;1807   .PAGE 'MODULE REVISION HISTORY'
;1808  ;*****************************************************************************
;1809  ;
;1810  ;
;1811  ; MODULE NAME: ESKAR4A
;1812  ;
;1813  ; CREATION DATE:  SEPTEMBER 1982
;1814  ; AUTHOR:  DAN GRIGORE
;1815  ;
;1816  ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1817  ;
;1818  ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1819  ;
;1820  ; -  WHAT CHANGE WAS MADE
;1821  ;
;1822  ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1823  ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1824  ;
;1825  ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1826  ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1827  ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1828  ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1829  ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1830  ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1831  ;    ESKAR3C.
;1832  ;
;1833  ; START OF REVISION HISTORY:
;1834  ;
;1835  ; MODIFIED BY:
;1836  ;
;1837  ;  1.1 March 10, 1983  Paul Hakala
;1838  ;   Modified the GET.MEMORY.SIZE routine to calculate
;1839  ;   the correct memory address when 256k ram chips are
;1840  ;   present.
;1841  ;
;1842  ;   March 10, 1983  Paul Hakala
;1843  ;   Removed a call to to LOAD.TEMP.REG that wasnt
;1844  ;   needed in test 31 RAS/CAS test
;1845  ;
;1846  ;
;1847  ;
;1848  ;*****************************************************************************
;1849  ;
```

            ;1852  .TOC " Micro Trap Handler and LSI-11 Support Routines"
            ;1853  .TOC "   Micro Trap Handler"
            ;1854 ;++
            ;1855 ; FUNCTIONAL DESCRIPTION:
            ;1856 ;
            ;1857 ; This routine is responsible for 'catching' micro-traps
            ;1858 ; and reporting unexpected traps to the Monitor. Register R[0F]
            ;1859 ; contains the Trap-Expected Mask. If the specified bit is set in
            ;1860 ; the mask, the bit is cleared and a RETURN0 is made otherwise,
            ;1861 ; an error call is made.
            ;1862 ;
            ;1863 ; INPUT PARAMETERS:
            ;1864 ;
            ;1865 ; R[0F] - Expected Trap Mask
            ;1866 ;  Trap Code Function
            ;1867 ;  ---------      --------
            ;1868 ;       0  System Init
            ;1869 ;       1  Data Unaligned

            ;1935 ;++
            ;1936 ; FUNCTIONAL DESCRIPTION:
            ;1937 ;
            ;1938 ; This routine Initializes the following registers:
            ;1939 ;  PSL    to 1F
            ;1940 ;  CES    to 0
            ;1941 ;  ACC.CS   to disable accellerator
            ;1942 ;  SIR    to 0
            ;1943 ;  CLK.CS   to stop interval timer
            ;1944 ;  TBER0   to disable the TB
            ;1945 ;  SBI.MAINT to    0
            ;1946 ;  SBI.ERR   to 0
            ;1947 ;  FAULT   to 0
            ;1948 ;  COMP    to 0
            ;1949 ;  RC[0E]    to  0
            ;1950 ;  R[0F]    to 0
            ;1951 ; It also performs an SBI UNJAM and disables the CACHE.
            ;1952 ; A SCOPE call is then made to the Monitor.
            ;1953 ;

;2331 ;    will  be  cleared  by  the  NEWTST subroutine.) The pointer in ID
```

```
;2332 ;    Register 39 can be interpreted as follows:
;2333 ;
;2334 ;     b00   -   Value that ID Reg 39 should hold when the subroutine is
;2335 ;               called the first time.  When this code is encountered
;2336 ;               this subroutine will try to select the lower controller.
;2337 ;               If the lower controller is misconfigured, the pointer in
;2338 ;               ID Reg 39  is changed to b01 (See below) and the subroutine
;2339 ;               is re-entered.
;2340 ;               If, however there is no misconfiguration, the value in
;2341 ;               ID Reg 39 is changed to b10 and a Return2 is made to the
;2342 ;               calling test.
;2343 ;
;2344 ;    b01  -     This value signifies that an attempt at configuring the
;2345 ;               lower controller failed, and the subroutine will attempt
;2346 ;               to select the upper controller.
;2347 ;               If the upper controller is also misconfigured execution
;2348 ;               stops with a call to ERROR1.
;2349 ;               If there is no misconfiguration on this controller, then
;2350 ;               the code in ID Reg 39 is changed to b11 and a Return2 is
;2351 ;               made to the calling test.
;2352 ;
;2353 ;    b10  -     This value signifies that the lower controller was selected
;2354 ;               previously and the test was executed once.  If the
;2355 ;               subroutine is entered with this code in ID Reg 39, ID Reg
;2356 ;               39 is loaded with b11 and an attempt is made to select the
;2357 ;               upper controller.
;2358 ;               If there is a misconfiguration on this controller, this
;2359 ;               subroutine is just re-entered.
;2360 ;               Otherwise, a Return2 will be made to the calling test.
;2361 ;
;2362 ;    b11   -    This code identifies the cases in which the test has
;2363 ;               been executed at least once (i.e., at least one of the
;2364 ;               controllers on the MS780-E unit under test could be
;2365 ;               configured properly).  When this code is detected the
;2366 ;               subroutine clears ID Reg 39 and makes a call to
;2367 ;               ENABLE.NEXT.MS780E.  If all MS780-E units have been
;2368 ;               tested then the subroutine executes a Return1.
;2369 ;               Otherwise the subroutine is re-entered.
;2370 ;
;2371 ;
;2372 ; Calling Constraint: =00
;2373 ; ------------------
;2374 ;
;2375 ;
;2376 ; Inputs:
;2377 ; ------
;2378 ;
;2379 ; ID Register 39 must be cleared by NEWTST
;2380 ;
;2381 ;
;2382 ; Outputs:
;2383 ; -------
;2384 ;
;2385 ; RC[0E] will have the I/O Base address of MS780-E/H to be tested
;2386 ; RC[0D] will be set up with the CNFG Register C/D of Controller
```

```

            ;3009  .TOC "   ENABLE NEXT MS780-E"
            ;3010 ;**
            ;3011 ; FUNCTIONAL DESCRIPTION:
            ;3012 ;
            ;3013 ;          This diagnostic will  be able to handle up  to  four  MS780-E units.
            ;3014 ;    They will be tested  separately, according to the TR level at which
            ;3015 ;    they are located,  starting with the one  at the lowest level first.
            ;3016 ;          When  a test has finished  with the first unit, it will have to call
            ;3017 ;    this specific  routine  to see  if any other MS780-E unit is present
            ;3018 ;    on the SBI. If more units are  present, the first one  will be  dis-
            ;3019 ;    abled  by  setting  its  starting  address to maximum, the next unit
            ;3020 ;    will be  enabled  by  setting its starting address to 0 and the test
            ;3021 ;    will be restarted. Subroutine  FIND.MS780E  will  look  on  the  SBI
            ;3022 ;    for  MS780-E/H  subsystems, and will leave their I/O base address in
            ;3023 ;    ID registers 3A through 3D and  a count of the Total number of units
            ;3024 ;    found - 1 in register 3E. In this subroutine the SC register is used
            ;3025 ;    as  a  pointer  to  ID  registers 3A through 3D.

;3973  .PAGE
;3974  .TOC "   FIND CONTROLLERS"
;3975 ;*****************************************************
;3976 ;**
;3977 ;
;3978 ; Functional Description:
;3979 ; ----------------------
;3980 ;
;3981 ;
;3982 ;      This subroutine is called by tests that need to know how
;3983 ; many  controllers  are available on the MS780-E/H currently under
;3984 ; test.  It makes use of subroutine SELECT.CNTRLR to put the
;3985 ; controllers in different Interleave Modes.
;3986 ; The subroutine returns control to the calling routine by either
;3987 ; one of:  Return1, Return2, Return3 or Return4.  It is up to the
;3988 ; test to decode this information as necessary.
;3989 ; Since some Tests require this feature, the subroutine also finds
;3990 ; the memory size available on each controller and leaves it in
;3991 ; registers R[0] and R[1].
;3992 ;
;3993 ;
;3994 ; Calling Constraint: =000
;3995 ; ------------------
;3996 ;
;3997 ;
;3998 ; Inputs:
;3999 ; ------
;4000 ;
;4001 ; RC[0E] MUST HOLD THE I/O BASES ADDRESS OF THE MS780-E/H
;4002 ; UNDER TEST
;4003 ;
;4004 ; Outputs:
;4005 ; -------
;4006 ;
;4007 ; - Return1, Return2, Return3 or Return4 depending on
;4008 ;   how many Controllers were found
;4009 ;
;4010 ; - R[0] Size of Memory on the Lower Controller
;4011 ;   R[1] Size of Memory on the Upper Controller
;4012 ;
;4013 ; Side Effects:

;4094  .PAGE "TEST 1BB COLUMN/ROW SELECT ADDRESSING"
;4095 ;*************************************************************
;4096 ;+++
;4097 ;
;4098 ; Functional Description:
;4099 ; ---------------------
;4100 ;
;4101 ; This test is designed to detect addressing errors in the RAM Column and
;4102 ; Row Addressing lines, bits <17:02> of the SBI REC lines or bits <19:02>
;4103 ; if 256k RAM chips are present.  The test keeps running count through
;4104 ; each field (Column or Row) while keeping the other constant at 0.
;4105 ;
;4106 ; The test makes a first "sweep" through the RAS/CAS lines writing data
;4107 ; of zero.  The next sweep reads back the data previously written and
;4108 ; makes sure that it is intact.  If it is, a unique Reed-Muller error
;4109 ; correcting code is written to the location.  A last "sweep" of the
;4110 ; RAS/CAS address lines is made reading the encoded patterns, decoding
;4111 ; them and making sure they are equal to the expected.

;1844  .TOC "   Micro Trap Handler"
;1845 ;++
;1846 ; FUNCTIONAL DESCRIPTION:
;1847 ;
;1848 ; This routine is responsible for 'catching' micro-traps
;1849 ; and reporting unexpected traps to the Monitor. Register R[0F]
;1850 ; contains the Trap-Expected Mask. If the specified bit is set in
;1851 ; the mask, the bit is cleared and a RETURN0 is made otherwise,
;1852 ; an error call is made.
;1853 ;
;1854 ; INPUT PARAMETERS:
;1855 ;
;1856 ; R[0F] - Expected Trap Mask
;1857 ;  Trap Code Function
;1858 ;  ---------      --------
;1859 ;       0  System Init
;1860 ;       1  Data Unaligned
;1861 ;       2  Cross Page
;1862 ;       3  TB Modify
;1863 ;       4  TB Protection
;1864 ;       6  TB Miss
;1865 ;       7  TB Parity
;1866 ;       8  Cache Parity
;1867 ;       9  Reserved Floating Operand
;1868 ;       C  Read Data Substitute
;1869 ;       D  Time out
;1870 ;       F  Control Store Parity Error
;1871 ;      10  Odd Address
;1872 ;
;1873 ; OUTPUT PARAMETERS:
;1874 ;
;1875 ; R[0F] - Mask bit is cleared.

;2211  .PAGE
;2212  .TOC "   START TEST"
;2213 ;*************************************************************
;2214 ;++
;2215 ;
;2216 ; Functional Description:
;2217 ; ---------------------
;2218 ;
;2219 ;         This subroutine will be called by all tests that  check  the
;2220 ;    controllers,  or  those  tests  that  have  to switch between the
;2221 ;    controllers when executing.   Its  main  functions  are:   select
;2222 ;    both  controllers  on the MS780-E/H SBI Interface and execute the
;2223 ;    test that called it, call out an error  if  neither  one  of  the
;2224 ;    controllers can be configured properly, if all the controllers on
;2225 ;    a MS780-E/H were configured and tested, it should select the next
;2226 ;    MS780-E/H on the SBI and repeat the above sequence.
;2227 ;    A test making use of this  subroutine  should  be  configured  as
;2228 ;    follows:
;2229 ;
;2230 ;
;2231 ;        Begin TEST.XX
;2232 ;        :
;2233 ;        :   Call NEWTST
;2234 ;        :   Call FIND.MS780E
;2235 ;        :   IF No MS780-E's on the SBI
;2236 ;        :     THEN
;2237 ;        :         Skip to End of TEST.XX
;2238 ;        :     ELSE
;2239 ;        :
;2240 ;        : RESTART.TEST.XX:
;2241 ;        :
;2242 ;        :   Call START TEST
;2243 ;        :   IF Return1 from START.TEST
;2244 ;        :     THEN
;2245 ;        :         Skip to End of TEST.XX
;2246 ;        :     ELSE.
;2247 ;        :
;2248 ;        ~
;2249 ;
;2250 ;        :
;2251 ;        :   Body of TEST.XX
;2252 ;        :
;2253 ;        ~
;2254 ;
;2255 ;        :   Jump RESTART.TEST.XX
;2256 ;        :
;2257 ;        End TEST.XX
;2258 ;
;2259 ;
;2260 ;          This subroutine makes use of a pointer  in  ID  Register  39
;2261 ;    (Temporary  Register  9)  to  "remember"  at  which point control
;2262 ;    should be passed when the subroutine is called a second, third or
;2263 ;    fourth  time, depending on the number of MS780-E's on the SBI and
;2264 ;    the numbers of controllers on each.  (Note:  Temporary Register 9
;2265 ;    will  be  cleared  by  the  NEWTST subroutine.) The pointer in ID
```

```
;2266 ;    Register 39 can be interpreted as follows:
;2267 ;
;2268 ;     b00   -   Value that ID Reg 39 should hold when the subroutine is
;2269 ;               called the first time.  When this code is encountered
;2270 ;               this subroutine will try to select the lower controller.
;2271 ;               If the lower controller is misconfigured, the pointer in
;2272 ;               ID Reg 39  is changed to b01 (See below) and the subroutine
;2273 ;               is re-entered.
;2274 ;               If, however there is no misconfiguration, the value in
;2275 ;               ID Reg 39 is changed to b10 and a Return2 is made to the
;2276 ;               calling test.
;2277 ;
;2278 ;    b01  -     This value signifies that an attempt at configuring the
;2279 ;               lower controller failed, and the subroutine will attempt
;2280 ;               to select the upper controller.
;2281 ;               If the upper controller is also misconfigured execution
;2282 ;               stops with a call to ERROR1.
;2283 ;               If there is no misconfiguration on this controller, then
;2284 ;               the code in ID Reg 39 is changed to b11 and a Return2 is
;2285 ;               made to the calling test.
;2286 ;
;2287 ;    b10  -     This value signifies that the lower controller was selected
;2288 ;               previously and the test was executed once.  If the
;2289 ;               subroutine is entered with this code in ID Reg 39, ID Reg
;2290 ;               39 is loaded with b11 and an attempt is made to select the
;2291 ;               upper controller.
;2292 ;               If there is a misconfiguration on this controller, this
;2293 ;               subroutine is just re-entered.
;2294 ;               Otherwise, a Return2 will be made to the calling test.
;2295 ;
;2296 ;    b11    -   This code identifies the cases in which the test has
;2297 ;               been executed at least once (i.e., at least one of the
;2298 ;               controllers on the MS780-E unit under test could be
;2299 ;               configured properly).  When this code is detected the
;2300 ;               subroutine clears ID Reg 39 and makes a call to
;2301 ;               ENABLE.NEXT.MS780E.  If all MS780-E units have been
;2302 ;               tested then the subroutine executes a Return1.
;2303 ;               Otherwise the subroutine is re-entered.
;2304 ;

            ;3026  .TOC "   ENABLE NEXT MS780-E"
            ;3027 ;**
            ;3028 ; FUNCTIONAL DESCRIPTION:
            ;3029 ;
            ;3030 ;          This diagnostic will  be able to handle up  to  four  MS780-E units.
            ;3031 ;    They will be tested  separately, according to the TR level at which
            ;3032 ;    they are located,  starting with the one  at the lowest level first.
            ;3033 ;          When  a test has finished  with the first unit, it will have to call
            ;3034 ;    this specific  routine  to see  if any other MS780-E unit is present
            ;3035 ;    on the SBI. If more units are  present, the first one  will be  dis-
            ;3036 ;    abled  by  setting  its  starting  address to maximum, the next unit
            ;3037 ;    will be  enabled  by  setting its starting address to 0 and the test
            ;3038 ;    will be restarted. Subroutine  FIND.MS780E  will  look  on  the  SBI
            ;3039 ;    for  MS780-E/H  subsystems, and will leave their I/O base address in
            ;3040 ;    ID registers 3A through 3D and  a count of the Total number of units
            ;3041 ;    found - 1 in register 3E. In this subroutine the SC register is used
            ;3042 ;    as  a  pointer  to  ID  registers 3A through 3D.

;3251   .PAGE "TEST 1BD CHECK BITS GENERATION"
;3252  ;*************************************************************
;3253  ;***
;3254  ;
;3255  ; Functional Description:
;3256  ; ----------------------
;3257  ;
;3258  ; This test makes use of Controller Diagnostic Mode 1 to verify the
;3259  ; correct functioning of the ECC generation circuitry.  In this mode,
;3260  ; memory Write/Read cycles are excuted normally except that on Writes
;3261  ; the check bits generated are also written to CNFG C (or D) register
;3262  ; bits <06:00>.  After writing the array, these bits are read back and
;3263  ; tested for correctness.  It is expected that the check bits read will
;3264  ; show a pattern of one floated in a field of zeroes.
;3265  ;
;3266  ; The data patterns will be stored in cache and they are as follows:
;3267  ;
;3268  ; Expected Check Bits Data Pattern

;3446  .PAGE "TEST 1BE SINGLE BIT ERROR DETECTION"
;3447 ;************************************************************
;3448 ;***
;3449 ;
;3450 ; Functional Description:
;3451 ; ----------------------
;3452 ;
;3453 ; This test verifies the detection of CRD errors.  It is performed by
;3454 ; setting the Controller in Diagnostics Mode 2, and forcing a CRD error.
;3455 ; It is expected that: a CRD tag will be sent on the SBI, bit 9 in CNFG
;3456 ; Register C/D is set and the syndrome bits are latched in CNFG C
;3457 ; register.
;3458 ;
;3459 ; The test floats a one across a field of zeroes and a zero accross a
;3460 ; field of ones while forcing CRD errors.  The syndrome bits will be
;3461 ; stored in cache, an they are as follows:
;3462 ;
;3463  ;% 40
;3464  ;$ 4A4F,5452,5857,5D5B,2523,2926,2C2A,3431
;3465  ;$ 0B0E,1513,1916,1C1A,6462,6867,6D6B,7570
;3466 ;
;3467 ;   SUBTEST 1
;3468 ;
;3469 ; This subtest checks whether a CRD bit can be detected in any bit
;3470 ; position while the bit in error is a one.
;3471 ;
;3472 ;   SUBTEST 2
;3473 ;
;3474 ; This subtest is similar to the previous one except that in this case
;3475 ; the bit in error is a zero.
;3476 ;
;3477 ;
;3478 ; Logic Description:

;3826  .PAGE 'TEST 1BF SINGLE BIT ERROR CORRECTION PART 1'
;3827 ;*************************************************************
;3828 ;+++
;3829 ;
;3830 ; Functional Description:
;3831 ; ----------------------
;3832 ;
;3833 ; This test verifies that a single bit error in any bit position is
;3834 ; corrected properly.  The test makes use of Diagnostic Mode 2.  It
;3835 ; floats a one and a zero through location 0 of the array board while
;3836 ; forcing CRD error on Reads using bits <06:00> of CNFG B register,
;3837 ; using as substitute ECC bits those for data of zero (or all ones).
;3838 ; The data returned from memory and the data on the array is checked for
;3839 ; correctness.
;3840 ;
;3841 ;   SUBTEST 1
;3842 ;
;3843 ; In this subtest a one will be floated accross a field of zeroes.  The
;3844 ; expected data to be returned from the memory is of all 0's.
;3845 ;
;3846 ;   SUBTEST 2
;3847 ;
;3848 ; This subtest floats a zero accroxx a field of ones, and the expected
;3849 ; data to be returned from the memory is all 1's.
;3850 ;

;4116  .PAGE  'TEST 1C0 SINGLE BIT ERROR CORRECTION PART 2"
;4117 ;************************************************************
;4118 ;***
;4119 ;
;4120 ; Functional Description:
;4121 ; ----------------------
;4122 ;
;4123 ; For this test the array location 0 is initialized to 0 or to all ones
;4124 ; as the case may be.  Single bit errors are forced by using Diagnostic
;4125 ; mode 2 and by setting the substitute ECC bits in CNFG B register in
;4126 ; such a manner that when the data is read from the array a one will be
;4127 ; floated across a field of zeroes ( or its complement).  The ECC bit
;4128 ; pattern that will be used in this test will be stored in cache and they
;4129 ; are as follows:
;4130 ;
;4131  ;% C0
;4132  ;$ 4643,585E,545B,5157,292F,252A,2026,383D
;4133  ;$ 0702,191F,151A,1016,686E,646B,6167,797C
;4134 ;
;4135 ;   SUBTEST 1
;4136 ;
;4137 ; In this subtest a one will be floated across a field of zeroes.  The
;4138 ; expected data to be returned from the memory is of all 0's.
;4139 ;
;4140 ;   SUBTEST 2
;4141 ;
;4142 ; This subtest floats a zero across a field of one's, and teh expected
;4143 ; data to be returned from the memory is all 1's.
;4144 ;
;4145 ;

;4444  .PAGE "TEST 1C1 SINGLE BIT ERROR CORRECTION PART 3"
;4445 ;************************************************************
;4446 ;***
;4447 ;
;4448 ; Functional Description:
;4449 ; ---------------------
;4450 ;
;4451 ; This test verifies whether the ECC logic can detect and correct an
;4452 ; error in the check bits (in any bit position).  it initializes the
;4453 ; array location 0 to all zeroes.  One bit at a time the test comple-
;4454 ; ments the check bits for data of 0, and writes them to CNFG reg B.
;4455 ; In diagnostic mode 2, the data is read from the array.  It is
;4456 ; expected that the check bits will be corrected, the data returned
;4457 ; (and the data on the array) is still 0, the CRD bit in CNFG Reg C/D
;4458 ; is sets (bit 9), and that the correct syndromes are latched.
;4459 ;
;4460 ; The expected syndromes for this test will be generated by the test,
;4461 ; and they are as follows:
;4462 ;
;4463 ;  Check bit in error Syndrome
;4464 ;  ------------------ --------
;4465 ;
;4466 ;   Cx      01

;4842  .PAGE "TEST 1C2 DOUBLE BIT ERROR TEST PART 1"
;4843 ;*************************************************************
;4844 ;+++
;4845 ;
;4846 ; Functional Description:
;4847 ; ----------------------
;4848 ;
;4849 ; This test forces double bit errors and verifies that they are detected.
;4850 ; It makes use of Diagnostic mode 2 and errors are forced in two bits of
;4851 ; location 0 on each Controller.  The test passes only if the following
;4852 ; are true: RDS tag is sent on the SBI when a double bit error occurrs,
;4853 ; bits 28 (Error Log Request) and 10 (RDS error) in CNFG C (or D)
;4854 ; register are set, the data is unmodified on the array and the error
;4855 ; syndrome contains an even number of ones (ie., the ECC logic detects
;4856 ; a RDS).
;4857 ;
;4858 ; The test will float two ones in a field of zeroes through location 0
;4859 ; while forcing RDS errors by setting the ECC substitute bits in CNFG
;4860 ; Register B to xC (for data of all zeroes).
;4861 ;
;4862 ;

;5256  .PAGE "TEST 1C3 DOUBLE BIT ERROR PART 2"
;5257 ;*************************************************************
;5258 ;***
;5259 ;
;5260 ; Functional Description:
;5261 ; ----------------------
;5262 ;
;5263 ; This sequence of subtests further test the ability of the ECC logic to
;5264 ; detect and log RDS errors.  The errors are forced both in the check
;5265 ; bits and in the data bits as detailed below.  All of these subtests
;5266 ; make use of Diagnostic mode 2 in order to force the RDS error.
;5267 ;
;5268 ;   SUBTEST 1
;5269 ;
;5270 ; This Subtest verifies the ability of the ECC logic to detect RDS errors
;5271 ; when any of the data bits is in error.  This first subtest will float
;5272 ; two ones through a field of zeroes.
;5273 ;
;5274 ;   SUBTEST 2
;5275 ;
;5276 ; This subtest is very similar to the first one.  The difference between
;5277 ; the two is the fact that in this case two zeroes are floated through a
;5278 ; field of ones.
;5279 ;
;5280 ;   SUBTEST 3
;5281 ;
;5282 ; This subtest checks the ability of the ECC logic to detect a RDS error
;5283 ; when one error occurs in the check bits and the other in the data.
;5284 ;

;1808 ;*****************************************************************************
;1809 ;
;1810 ;
;1811 ; MODULE NAME: ESKAR4C
;1812 ;
;1813 ; CREATION DATE:  SEPTEMBER 1982
;1814 ; AUTHOR:  DAN GRIGORE
;1815 ;
;1816 ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1817 ;
;1818 ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1819 ;
;1820 ; -  WHAT CHANGE WAS MADE
;1821 ;
;1822 ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1823 ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1824 ;
;1825 ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1826 ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1827 ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1828 ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1829 ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1830 ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1831 ;    ESKAR3C.
;1832 ;
;1833 ; START OF REVISION HISTORY:
;1834 ;
;1835 ; MODIFIED BY:
;1836 ;
;1837 ;  1.1 March 10, 1983  Paul Hakala
;1838 ;   Modified the GET.MEMORY.SIZE routine to calculate
;1839 ;   the correct memory address when 256k ram chips are
;1840 ;   present.
;1841 ;
;1842 ;
;1843 ;
;1844 ;

;1849
;1850  .TOC " Micro Trap Handler and LSI-11 Support Routines"
;1851  .TOC "   Micro Trap Handler"
;1852 ;++
;1853 ; FUNCTIONAL DESCRIPTION:
;1854 ;
;1855 ; This routine is responsible for 'catching' micro-traps
;1856 ; and reporting unexpected traps to the Monitor. Register R[0F]
;1857 ; contains the Trap-Expected Mask. If the specified bit is set in
;1858 ; the mask, the bit is cleared and a RETURN0 is made otherwise,
;1859 ; an error call is made.
;1860 ;
;1861 ; INPUT PARAMETERS:
;1862 ;
;1863 ; R[0F] - Expected Trap Mask
;1864 ;  Trap Code Function
;1865 ;  ---------     --------
;1866 ;       0  System Init
;1867 ;       1  Data Unaligned
;1868 ;       2  Cross Page
;1869 ;       3  TB Modify
;1870 ;       4  TB Protection
;1871 ;       6  TB Miss
;1872 ;       7  TB Parity
;1873 ;       8  Cache Parity
;1874 ;       9  Reserved Floating Operand
;1875 ;       C  Read Data Substitute
;1876 ;       D  Time out
;1877 ;       F  Control Store Parity Error
;1878 ;      10  Odd Address
;1879 ;
;1880 ; OUTPUT PARAMETERS:
;1881 ;
;1882 ; R[0F] - Mask bit is cleared.

;2220 ;*************************************************************
;2221 ;**
;2222 ;
;2223 ; Functional Description:
;2224 ; ---------------------
;2225 ;
;2226 ;         This subroutine will be called by all tests that  check  the
;2227 ;    controllers,  or  those  tests  that  have  to switch between the
;2228 ;    controllers when executing.  Its main functions are:  select
;2229 ;    both  controllers  on the MS780-E/H SBI Interface and execute the
;2230 ;    test that called it, call out an error  if  neither  one  of  the
;2231 ;    controllers can be configured properly, if all the controllers on
;2232 ;    a MS780-E/H were configured and tested, it should select the next
;2233 ;    MS780-E/H on the SBI and repeat the above sequence.
;2234 ;    A test making use of this  subroutine  should  be  configured  as
;2235 ;    follows:
;2236 ;
;2237 ;
;2238 ;       Begin TEST.XX
;2239 ;       :
;2240 ;       :   Call NEWTST
;2241 ;       :   Call FIND.MS780E
;2242 ;       :   IF No MS780-E's on the SBI
;2243 ;       :     THEN
;2244 ;       :         Skip to End of TEST.XX
;2245 ;       :     ELSE
;2246 ;       :
;2247 ;       : RESTART.TEST.XX:
;2248 ;       :
;2249 ;       :   Call START TEST
;2250 ;       :   IF Return1 from START.TEST
;2251 ;       :     THEN
;2252 ;       :         Skip to End of TEST.XX
;2253 ;       :     ELSE.
;2254 ;       :
;2255 ;       ~
;2256 ;       ~
;2257 ;       :
;2258 ;       :   Body of TEST.XX
;2259 ;       :
;2260 ;       ~
;2261 ;       ~
;2262 ;       :   Jump RESTART.TEST.XX
;2263 ;       :
;2264 ;       End TEST.XX
;2265 ;
;2266 ;
;2267 ;         This subroutine makes use of a pointer  in  ID  Register  39
;2268 ;    (Temporary  Register  9)  to  remember  at  which point control
;2269 ;    should be passed when the subroutine is called a second, third or
;2270 ;    fourth  time, depending on the number of MS780-E's on the SBI and
;2271 ;    the numbers of controllers on each.  (Note:  Temporary Register 9
;2272 ;    will  be  cleared  by  the  NEWTST subroutine.) The pointer in ID
```

```
;2273 ;    Register 39 can be interpreted as follows:
;2274 ;
;2275 ;     b00   -   Value that ID Reg 39 should hold when the subroutine is
;2276 ;               called the first time.  When this code is encountered
;2277 ;               this subroutine will try to select the lower controller.
;2278 ;               If the lower controller is misconfigured, the pointer in
;2279 ;               ID Reg 39  is changed to b01 (See below) and the subroutine
;2280 ;               is re-entered.
;2281 ;               If, however there is no misconfiguration, the value in
;2282 ;               ID Reg 39 is changed to b10 and a Return2 is made to the
;2283 ;               calling test.
;2284 ;
;2285 ;     b01   -   This value signifies that an attempt at configuring the
;2286 ;               lower controller failed, and the subroutine will attempt
;2287 ;               to select the upper controller.
;2288 ;               If the upper controller is also misconfigured execution
;2289 ;               stops with a call to ERROR1.
;2290 ;               If there is no misconfiguration on this controller, then
;2291 ;               the code in ID Reg 39 is changed to b11 and a Return2 is
;2292 ;               made to the calling test.
;2293 ;
;2294 ;     b10   -   This value signifies that the lower controller was selected
;2295 ;               previously and the test was executed once.  If the
;2296 ;               subroutine is entered with this code in ID Reg 39, ID Reg
;2297 ;               39 is loaded with b11 and an attempt is made to select the
;2298 ;               upper controller.
;2299 ;               If there is a misconfiguration on this controller, this
;2300 ;               subroutine is just re-entered.
;2301 ;               Otherwise, a Return2 will be made to the calling test.
;2302 ;
;2303 ;     b11   -   This code identifies the cases in which the test has
;2304 ;               been executed at least once (i.e., at least one of the
;2305 ;               controllers on the MS780-E unit under test could be
;2306 ;               configured properly).  When this code is detected the
;2307 ;               subroutine clears ID Reg 39 and makes a call to
;2308 ;               ENABLE.NEXT.MS780E.  If all MS780-E units have been
;2309 ;               tested then the subroutine executes a Return1.
;2310 ;               Otherwise the subroutine is re-entered.
;2311 ;
;2312 ;
;2313 ; Calling Constraint: =00
;2314 ; ------------------
;2315 ;
;2316 ;
;2317 ; Inputs:
;2318 ; ------
;2319 ;
;2320 ; ID Register 39 must be cleared by NEWTST
;2321 ;
;2322 ;
;2323 ; Outputs:
;2324 ; -------
;2325 ;
;2326 ; RC[0E] will have the I/O Base address of MS780-E/H to be tested
;2327 ; RC[0D] will be set up with the CNFG Register C/D of Controller

            ;2833  .TOC "   FIND MS780-E MEMORY"
            ;2834 ;++
            ;2835 ; FUNCTIONAL DESCRIPTION:
            ;2836 ;
            ;2837 ;          The diagnostic is designed to handle up to 4 (four)
            ;2838 ;     MS780-E/H's on the 780 SBI.  This routine looks at all TR levels
            ;2839 ;     for a MS780-E memory unit.  Upon return, ID registers 3A through
            ;2840 ;     3D will hold the I/O base address of the MS780-E subsystems found
            ;2841 ;     on the SBI, and ID Register 3E will hold the Total number of
            ;2842 ;     MS780-E/H's found minus one.  Also, it is to be noted that the
            ;2843 ;     first MS780-E found will have its starting address set to 0
            ;2844 ;     (zero).
            ;2845 ;     All the other MS780-E/H's found will have their starting address
            ;2846 ;     set to all ones.  Subroutine ENABLE.NEXT.MS780E will look at ID
            ;2847 ;     Reg 3E to decide if there are any more MS780-E and will take
            ;2848 ;     apropriate action.  Register RC[0E] is used as a pointer to the
            ;2849 ;     current MS780-E unit under test.
            ;2850 ;     If any of: MS780-A, MS780-C or MA780 is found, its address is
            ;2851 ;     set to maximum.
            ;2852 ;

            ;3033  .PAGE
            ;3034  .TOC "   ENABLE NEXT MS780-E"
            ;3035 ;++
            ;3036 ; FUNCTIONAL DESCRIPTION:
            ;3037 ;
            ;3038 ;          This diagnostic will  be able to handle up  to  four  MS780-E units.
            ;3039 ;    They will be tested  separately, according to the TR level at which
            ;3040 ;    they are located,  starting with the one  at the lowest level first.
            ;3041 ;          When  a test has finished  with the first unit, it will have to call
            ;3042 ;    this specific  routine  to see  if any other MS780-E unit is present
            ;3043 ;    on the SBI. If more units are  present, the first one  will be  dis-
            ;3044 ;    abled  by  setting  its  starting  address to maximum, the next unit
            ;3045 ;    will be  enabled  by  setting its starting address to 0 and the test
            ;3046 ;    will be restarted. Subroutine  FIND.MS780E  will  look  on  the  SBI
            ;3047 ;    for  MS780-E/H  subsystems, and will leave their I/O base address in
            ;3048 ;    ID registers 3A through 3D and  a count of the Total number of units
            ;3049 ;    found - 1 in register 3E. In this subroutine the SC register is used
            ;3050 ;    as  a  pointer  to  ID  registers 3A through 3D.

;3330  .TOC "   FORCE CRD-RDS ERROR AND READ"
;3331 ;*************************************************************
;3332 ;**
;3333 ;
;3334 ; Functional Description:
;3335 ; ----------------------
;3336 ;
;3337 ;
;3338 ;      This subroutine will be used to force any combination of CRD
;3339 ; or RDS errors (or no errors whatsoever) in locations 0 and 4.  It
;3340 ; should be passed from the calling routine in Reg D  the  data  to
;3341 ; force  an  error  in location 0 and in Reg Q the data to force an
;3342 ; error in location 4.  The subroutine will  initialize  the  array
;3343 ; locations 0 and 4 with the data in registers D and Q, will select
;3344 ; Diagnostic Mode 2 and set the ECC substitute bits in CNFG  Reg  B
;3345 ; to  x0C.   An Extended Read will follow, thus forcing the errors,
;3346 ; followed by a Return1.
;3347 ;
;3348 ;
;3349 ; Calling Constraint: =0
;3350 ; ------------------
;3351 ;
;3352 ;
;3353 ; Inputs:
;3354 ; ------
;3355 ;
;3356 ; Registers D and Q MUST hold the following information:
;3357 ;
;3358 ; D - Data to force error in location 0
;3359 ;
;3360 ; Q - Data to force error in location 4
;3361 ;
;3362 ;
;3363 ; Outputs:
;3364 ; -------
;3365 ;
;3366 ; There are NO specific outputs from this routine.
;3367 ; However depending on the data in the D and Q registers
;3368 ; any combination of CRD/RDS errors  (or NO error at all)
;3369 ; will be forced in the memory.
;3370 ;
;3371 ;
;3372 ; Side Effects:

;3668  .PAGE "TEST 1C8 ERROR LOG AND HIGH ERROR RATE BITS TEST
;3669 ;*************************************************************
;3670 ;+++
;3671 ;
;3672 ; Functional Description:
;3673 ; ----------------------
;3674 ;
;3675 ; The test verifies that the High Error Rate bit, bit 29 of CNFG
;3676 ; Register C/D, and the Error Log Bit, bit 28 in the same register,
;3677 ; set and clear properly.
;3678 ;
;3679 ; The High Error Rate bit should only set when two consecutive errors
;3680 ; take place and the error bits are not cleared between them.  If a
;3681 ; single error occurs it is expected that the bit will no set.

;4053  .PAGE  'TEST 1C9 ERROR LOGGING (CRD/RDS) TEST
;4054 ;*************************************************************
;4055 ;+++
;4056 ;
;4057 ; Functional Description:
;4058 ; ----------------------
;4059 ;
;4060 ; This test will force similar set of errors as the previous one.
;4061 ; Except this time, the functionality of the syndrome error logging
;4062 ; bits (CNFG Reg C/D bits <6:0>) and CRD, RDS flags (bits <10:9>) in
;4063 ; the same register) will be tested.
;4064 ;
;4065 ;   [Subtest 1:]
;4066 ;
;4067 ; In this subtest it is expected that the error syndromes for the first
;4068 ; CRD error will be logged and that the correct flag is set( bit 9).
;4069 ;
;4070 ;   [Subtest 2:]
;4071 ;
;4072 ; In this subtest it is expected that the first error is logged in the
;4073 ; syndrome bits, and that the correct flag is set (bit 10).
;4074 ;
;4075 ;   [Subtest 3:]
;4076 ;
;4077 ; This subtest expects that the syndrome bits log the RDS error and
;4078 ; ignore the CRD.  Also the RDS error should clear the CRD error flag
;4079 ; and set the RDS flag.
;4080 ;
;4081 ;   [Subtest 4:]
;4082 ;
;4083 ; It is expected in this subtest that the syndrome logged will be those
;4084 ; for the RDS error and that the CRD error does not over-write the error
;4085 ; data for the RDS
;4086 ;
;4087 ; Logic Description:
;4088 ; -----------------
;4089 ; N/A
;4090 ;
;4091 ;
;4092 ; Error Logout:

;4389 ;************************************************************
;4390 ;***
;4391 ;
;4392 ; Functional Description:
;4393 ; ----------------------
;4394 ;
;4395 ; This test checks that the Error Address bits in CNFG C (or D) register,
;4396 ; bits <27:11>, are loaded with the correct address when an error occurs.
;4397 ; The addresses at which errors are forced are picked in such a manner
;4398 ; that upon reading the error address field, a specific pattern will be
;4399 ; returned.
;4400 ;
;4401 ;
;4402 ; Logic Description:

;4715  .PAGE  TEST 1CB SINGLE/DOUBLE BIT ERROR DETECT. ON EXT READS
;4716 ;*************************************************************
;4717 ;+++
;4718 ;
;4719 ; Functional Description:
;4720 ; ----------------------
;4721 ;
;4722 ; The following sequence of subtests forces errors in both longwords of
;4723 ; a quadword at locations 0 and 4 on each controller, while performing
;4724 ; Extended Reads.  CRD, RDS, HIGH ERROR RATE and ERROR LOG bits in CNFG
;4725 ; C/D are checked to see whether they are set or not (depending on what
;4726 ; the test is supposed to do).
;4727 ;
;4728 ; In all the subtests below, the contents of the SBI.ERR register will
;4729 ; be checked for the appropriate condition (ie., CRD bit set, RDS bit set
;4730 ; or both set).  This will verify that the respective tags were sent on
;4731 ; the SBI, and that the SBI detected them.
;4732 ;
;4733 ;   [Subtest 1:]
;4734 ;
;4735 ; This subtest forces a CRD error in the upper longword on an Extended
;4736 ; Read and verifies normal operation:  CRD tag sent on the SBI, corrected
;4737 ; data returned from memory and that the data corrected on the array.
;4738 ; Also, a check is made to see that in CNFG C/D register, the CRD bit and
;4739 ; the Error logout bit are set while the RDS and High Error Rate bits
;4740 ; are clear.
;4741 ;
;4742 ;   [Subtest 2:]
;4743 ;
;4744 ; A RDS error is forced in the upper longword, only, during an Extended
;4745 ; Read.  It is expected that:  no micro trap will occur, RDS tag sent to
;4746 ; the CPU, data is not corrected on the array and the proper syndrome
;4747 ; bits were generated.  Also CNFG C/D register will be checked to verify
;4748 ; that the RDS and Error Log bits are set while the CRD and High Error
;4749 ; rate are clear.
;4750 ;
;4751 ;   [Subtest 3:]
;4752 ;
;4753 ; This subtest forces a CRD error in the lower longword and a RDS error
;4754 ; in the upper longword.  It is expected that no RDS micro trap will
;4755 ; occur.  Contents of CNFG C/D register are expected to show both RDS
;4756 ; and CRD bits set, as well as the High Error Rate bit and the Error
;4757 ; Log bit set.
;4758 ;
;4759 ;   [Subtest 4:]
;4760 ;
;4761 ; A RDS error is forced in the lower longword and a CRD in the upper
;4762 ; longword on Extended Reads.  A micro-trap should occur for the RDS
;4763 ; error.  The following bits in CNFG C/D register should be set:  RDS,
;4764 ; CRD, High Error Rate, and Error log.
;4765 ;
;4766 ;
;4767 ; Logic Description:
;4768 ; -----------------
;4769 ;

;1809 ;
;1810 ;
;1811 ; MODULE NAME: ESKAR4D
;1812 ;
;1813 ; CREATION DATE:  SEPTEMBER 1982
;1814 ; AUTHOR:  DAN GRIGORE
;1815 ;
;1816 ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1817 ;
;1818 ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1819 ;
;1820 ; -  WHAT CHANGE WAS MADE
;1821 ;
;1822 ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1823 ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1824 ;
;1825 ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1826 ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1827 ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1828 ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1829 ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1830 ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1831 ;    ESKAR3C.
;1832 ;

            ;1841  .PAGE
            ;1842
            ;1843  .TOC   MICRO TRAP HANDLER AND LSI-MONITER CALL ROUTINES
            ;1844 ;+
            ;1845 ; FOLLOWING ARE THE MICRO TRAP VECTOR ASSIGNMENTS. EACH VECTOR LOADS THE SC
            ;1846 ; WITH A NUMBER, AND LOADS THE D REGISTER WITH THE CONTENTS OF R[0F].
            ;1847 ; R[0F] IS SETUP BY THE PROGRAM TO INDICATE WHETHER A MICRO TRAP IS EXPECTED
            ;1848 ; THIS IS DONE BY SETTING THE BIT IN R[0F] THAT CORRESPONDS TO THE NUMBER
            ;1849 ; THAT IS LOADED INTO THE SC BY THAT PARTICULAR MICRO TRAP.
            ;1850 ;
            ;1851 ; FOR EXAMPLE: IF A TEST EXPECTED A 'TB MISS  MICRO TRAP IT WOULD SET BIT
            ;1852 ; 6 IN SCRATCH PAD R[0F]. WHEN THE TRAP OCCURRED, THE TRAP CATCHER
            ;1853 ; ROUTINE WOULD SENSE THAT THE TRAP WAS EXPECTED AND CLEAR BIT 6 IN
            ;1854 ; R[0F] AND DO A RETURN0.
            ;1855 ;
            ;1856 ; IF THE BIT FOR THE PARTICULAR TRAP IS NOT SET IN R[0F], THE TRAP ROUTINE
            ;1857 ; READS THE ERROR REGISTERS, SAVES THEM FOR TYPEOUT, AND MAKES AN ERROR CALL
            ;1858 ; TO THE CONSOLE.
            ;1859 ;
            ;1860 ;-

                ;1913 ; FUNCTIONAL DESCRIPTION:
                ;1914 ;
                ;1915 ; This routine Initializes the following registers:
                ;1916 ;  PSL    to 1F
                ;1917 ;  CES    to 0
                ;1918 ;  ACC.CS    to disable accellerator
                ;1919 ;  SIR    to 0
                ;1920 ;  CLK.CS    to stop interval timer
                ;1921 ;  TBER0    to disable the TB
                ;1922 ;  SBI.MAINT to    0
                ;1923 ;  SBI.ERR    to 0
                ;1924 ;  FAULT    to 0
                ;1925 ;  COMP    to 0
                ;1926 ;  RC[0E]    to  0
                ;1927 ;  R[0F]    to 0
                ;1928 ; It also performs an SBI UNJAM and disables the CACHE.
                ;1929 ; A SCOPE call is then made to the Monitor.
                ;1930 ;

            ;2292  .TOC "   FIND MS780-E MEMORY"
            ;2293 ;**
            ;2294 ; FUNCTIONAL DESCRIPTION:
            ;2295 ;
            ;2296 ;          The diagnostic is designed to handle up to 4 (four)
            ;2297 ;     MS780-E/H's on the 780 SBI. This routine looks at all TR levels
            ;2298 ;     for a MS780-E memory unit.  Upon return, ID registers 3A through
            ;2299 ;     3D will hold the I/O base address of the MS780-E subsystems found
            ;2300 ;     on the SBI, and ID Register 3E will hold the Total number of
            ;2301 ;     MS780-E/H's found minus one. Also, it is to be noted that the
            ;2302 ;     first MS780-E found will have its starting address set to 0
            ;2303 ;     (zero).
            ;2304 ;     All the other MS780-E/H's found will have their starting address
            ;2305 ;     set to all ones. Subroutine ENABLE.NEXT.MS780E will look at ID
            ;2306 ;     Reg 3E to decide if there are any more MS780-E and will take
            ;2307 ;     apropriate action.  Register RC[0E] is used as a pointer to the
            ;2308 ;     current MS780-E unit under test.
            ;2309 ;     If any of: MS780-A, MS780-C or MA780 is found, its address is
            ;2310 ;     set to maximum.
            ;2311 ;

          ;2570 ;++
          ;2571 ; FUNCTIONAL DESCRIPTION:
          ;2572 ;
          ;2573 ;          This diagnostic will  be able to handle up  to  four  MS780-E units.
          ;2574 ;    They will be tested  separately, according to the TR level at which
          ;2575 ;    they are located,  starting with the one  at the lowest level first.
          ;2576 ;          When  a test has finished  with the first unit, it will have to call
          ;2577 ;    this specific  routine  to see  if any other MS780-E unit is present
          ;2578 ;    on the SBI. If more units are  present, the first one  will be  dis-
          ;2579 ;    abled  by  setting  its  starting  address to maximum, the next unit
          ;2580 ;    will be  enabled  by  setting its starting address to 0 and the test
          ;2581 ;    will be restarted. Subroutine  FIND.MS780E  will  look  on  the  SBI
          ;2582 ;    for  MS780-E/H  subsystems, and will leave their I/O base address in
          ;2583 ;    ID registers 3A through 3D and  a count of the Total number of units
          ;2584 ;    found - 1 in register 3E. In this subroutine the SC register is used
          ;2585 ;    as  a  pointer  to  ID  registers 3A through 3D.

;2859 ;**
;2860 ;
;2861 ;
;2862 ; 'CHET00.MIC'
;2863 ;
;2864 ; PRELIMINARY CACHE TEST, SIMPLE HITS AND MISSES,
;2865 ;    AND INVALIDATES
;2866 ;
;2867 ; TEST DESCRIPTION
;2868 ;
;2869 ; JUST CHECKS FOR CACHE HITS WITH READS TO MEMORY.
;2870 ; CHECKS THAT THE DATA IS FROM THE CACHE ON HITS, AND MEMORY ON
;2871 ; MISSES. THE 'MCT/INVALIDATE' FUNCTION WILL BE CHECKED ALSO.
;2872 ;
;2873 ; SEQUENCE OF EVENTS ARE :
;2874 ; -------- ----------------------------------------
;2875 ;  NOTE: ADDRESS REMAINS CONSTANT
;2876 ;
;2877 ; 1) WRITE INVALIDATE TO CACHE
;2878 ; 2) SHUT CACHE OFF, WRITE TEST DATA
;2879 ;  TO MAIN MEMORY
;2880 ; 3) TURN ON CACHE, READ MAIN MEMORY
;2881 ;  SEE: MISS
;2882 ;       PROPER DATA (-1)
;2883 ; 4) READ MAIN MEMORY (2ND TIME)
;2884 ;  SEE: HIT
;2885 ;       PROPER DATA (-1)
;2886 ; 5) SHUT SBI OFF, READ MAIN MEMORY
;2887 ;  SEE: HIT
;2888 ;       PROPER DATA (-1)
;2889 ; 6) SHUT SBI OFF, WRITE HIT WITH
;2890 ;  F0F0F0F0 (RA 4),I.E. WRITE UPDATE
;2891 ; 7) TURN SBI ON, READ, SEE WHERE DATA COMES FROM
;2892 ;  SEE: F0F0F0F0 (IT'S FROM CACHE)
;2893 ;       HIT ALSO
;2894 ; 8) WRITE INVALIDATE TO CACHE
;2895 ; 9) READ MAIN MEMORY
;2896 ;  SEE: MISS
;2897 ;       -1 FOR DATA READ(IT'S FROM MEMEORY)
;2898 ;
;2899 ; LOGIC DESCRIPTION
;2900 ;
;2901 ; IF HITS,MISSES ARE IMPROPER THE SBL(M8218) OR SBH(M8219)  BOARDS
;2902 ; IF A FEW DATA BITS ARE BAD THE THE MEMORY ARRAY CARDS MAY BE
;2903 ;  CORRUPTING THE DATA AS ECC IS INHIBITED
;2904 ; CACHE PRITY CHECKER ARE ACTIVE WILL HITS ARE PRESENT, SO THEY
;2905 ;  MAY CAUSE PROBLEMS
;2906 ; THE MD BUS DRIVERS ON THE SBI,SBL BOARDS ARE ACTIVE.
;2907 ;

;1809 ;
;1810 ;
;1811 ; MODULE NAME: ESKAR4E
;1812 ;
;1813 ; CREATION DATE:  SEPTEMBER 1982
;1814 ; AUTHOR:  DAN GRIGORE
;1815 ;
;1816 ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1817 ;
;1818 ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1819 ;
;1820 ; -  WHAT CHANGE WAS MADE
;1821 ;
;1822 ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1823 ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1824 ;
;1825 ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1826 ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1827 ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1828 ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1829 ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1830 ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1831 ;    ESKAR3C.
;1832 ;
;1833 ; START OF REVISION HISTORY:

            ;1841   .PAGE
            ;1842
            ;1843   .TOC " MICRO TRAP HANDLER AND LSI-MONITER CALL ROUTINES"
            ;1844 ;+
            ;1845 ; FOLLOWING ARE THE MICRO TRAP VECTOR ASSIGNMENTS. EACH VECTOR LOADS THE SC
            ;1846 ; WITH A NUMBER, AND LOADS THE D REGISTER WITH THE CONTENTS OF R[0F].
            ;1847 ; R[0F] IS SETUP BY THE PROGRAM TO INDICATE WHETHER A MICRO TRAP IS EXPECTED
            ;1848 ; THIS IS DONE BY SETTING THE BIT IN R[0F] THAT CORRESPONDS TO THE NUMBER
            ;1849 ; THAT IS LOADED INTO THE SC BY THAT PARTICULAR MICRO TRAP.
            ;1850 ;
            ;1851 ; FOR EXAMPLE: IF A TEST EXPECTED A "TB MISS" MICRO TRAP IT WOULD SET BIT
            ;1852 ; 6 IN SCRATCH PAD R[0F]. WHEN THE TRAP OCCURRED, THE TRAP CATCHER
            ;1853 ; ROUTINE WOULD SENSE THAT THE TRAP WAS EXPECTED AND CLEAR BIT 6 IN
            ;1854 ; R[0F] AND DO A RETURN0.
            ;1855 ;
            ;1856 ; IF THE BIT FOR THE PARTICULAR TRAP IS NOT SET IN R[0F], THE TRAP ROUTINE
            ;1857 ; READS THE ERROR REGISTERS, SAVES THEM FOR TYPEOUT, AND MAKES AN ERROR CALL
            ;1858 ; TO THE CONSOLE.
            ;1859 ;
            ;1860 ;-

            ;2591  .TOC "   FIND MS780-E MEMORY"
            ;2592 ;++
            ;2593 ; FUNCTIONAL DESCRIPTION:
            ;2594 ;
            ;2595 ;          The diagnostic is designed to handle up to 4 (four)
            ;2596 ;     MS780-E/H's on the 780 SBI. This routine looks at all TR levels
            ;2597 ;     for a MS780-E memory unit.  Upon return, ID registers 3A through
            ;2598 ;     3D will hold the I/O base address of the MS780-E subsystems found
            ;2599 ;     on the SBI, and ID Register 3E will hold the Total number of
            ;2600 ;     MS780-E/H's found minus one. Also, it is to be noted that the
            ;2601 ;     first MS780-E found will have its starting address set to 0
            ;2602 ;     (zero).
            ;2603 ;     All the other MS780-E/H's found will have their starting address
            ;2604 ;     set to all ones. Subroutine ENABLE.NEXT.MS780E will look at ID
            ;2605 ;     Reg 3E to decide if there are any more MS780-E and will take
            ;2606 ;     apropriate action.  Register RC[0E] is used as a pointer to the
            ;2607 ;     current MS780-E unit under test.
            ;2608 ;     If any of: MS780-A, MS780-C or MA780 is found, its address is
            ;2609 ;     set to maximum.

            ;2868  .TOC "    ENABLE NEXT MS780-E"
            ;2869 ;++
            ;2870 ; FUNCTIONAL DESCRIPTION:
            ;2871 ;
            ;2872 ;          This diagnostic will  be able to handle up  to  four  MS780-E units.
            ;2873 ;     They will be tested  separately, according to the TR level at which
            ;2874 ;     they are located,  starting with the one  at the lowest level first.
            ;2875 ;          When  a test has finished  with the first unit, it will have to call
            ;2876 ;     this specific  routine  to see  if any other MS780-E unit is present
            ;2877 ;     on the SBI. If more units are  present, the first one  will be  dis-
            ;2878 ;     abled  by  setting  its  starting  address to maximum, the next unit
            ;2879 ;     will be  enabled  by  setting its starting address to 0 and the test
            ;2880 ;     will be restarted. Subroutine  FIND.MS780E  will  look  on  the  SBI
            ;2881 ;     for  MS780-E/H  subsystems, and will leave their I/O base address in
            ;2882 ;     ID registers 3A through 3D and  a count of the Total number of units
            ;2883 ;     found - 1 in register 3E. In this subroutine the SC register is used
            ;2884 ;     as  a  pointer  to  ID  registers 3A through 3D.

;1809 ;
;1810 ;
;1811 ; MODULE NAME: ESKAR4F
;1812 ;
;1813 ; CREATION DATE:  SEPTEMBER 1982
;1814 ; AUTHOR:  DAN GRIGORE
;1815 ;
;1816 ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1817 ;
;1818 ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1819 ;
;1820 ; -  WHAT CHANGE WAS MADE
;1821 ;
;1822 ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1823 ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1824 ;
;1825 ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1826 ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1827 ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1828 ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1829 ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1830 ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1831 ;    ESKAR3C.
;1832 ;
;1833 ; START OF REVISION HISTORY:

            ;1841  .PAGE
            ;1842
            ;1843  .TOC " MICRO TRAP HANDLER AND LSI-MONITER CALL ROUTINES"
            ;1844 ;+
            ;1845 ; FOLLOWING ARE THE MICRO TRAP VECTOR ASSIGNMENTS. EACH VECTOR LOADS THE SC
            ;1846 ; WITH A NUMBER, AND LOADS THE D REGISTER WITH THE CONTENTS OF R[0F].
            ;1847 ; R[0F] IS SETUP BY THE PROGRAM TO INDICATE WHETHER A MICRO TRAP IS EXPECTED
            ;1848 ; THIS IS DONE BY SETTING THE BIT IN R[0F] THAT CORRESPONDS TO THE NUMBER
            ;1849 ; THAT IS LOADED INTO THE SC BY THAT PARTICULAR MICRO TRAP.
            ;1850 ;
            ;1851 ; FOR EXAMPLE: IF A TEST EXPECTED A "TB MISS" MICRO TRAP IT WOULD SET BIT
            ;1852 ; 6 IN SCRATCH PAD R[0F]. WHEN THE TRAP OCCURRED, THE TRAP CATCHER
            ;1853 ; ROUTINE WOULD SENSE THAT THE TRAP WAS EXPECTED AND CLEAR BIT 6 IN
            ;1854 ; R[0F] AND DO A RETURN0.
            ;1855 ;
            ;1856 ; IF THE BIT FOR THE PARTICULAR TRAP IS NOT SET IN R[0F], THE TRAP ROUTINE
            ;1857 ; READS THE ERROR REGISTERS, SAVES THEM FOR TYPEOUT, AND MAKES AN ERROR CALL
            ;1858 ; TO THE CONSOLE.
            ;1859 ;
            ;1860 ;-

            ;2192 ;**
            ;2193 ; FUNCTIONAL DESCRIPTION:
            ;2194 ;
            ;2195 ;          The diagnostic is designed to handle up to 4 (four)
            ;2196 ;     MS780-E/H's on the 780 SBI. This routine looks at all TR levels
            ;2197 ;     for a MS780-E memory unit.  Upon return, ID registers 3A through
            ;2198 ;     3D will hold the I/O base address of the MS780-E subsystems found
            ;2199 ;     on the SBI, and ID Register 3E will hold the Total number of
            ;2200 ;     MS780-E/H's found minus one. Also, it is to be noted that the
            ;2201 ;     first MS780-E found will have its starting address set to 0
            ;2202 ;     (zero).
            ;2203 ;     All the other MS780-E/H's found will have their starting address
            ;2204 ;     set to all ones.  Subroutine ENABLE.NEXT.MS780E will look at ID
            ;2205 ;     Reg 3E to decide if there are any more MS780-E and will take
            ;2206 ;     apropriate action.  Register RC[0E] is used as a pointer to the
            ;2207 ;     current MS780-E unit under test.
            ;2208 ;     If any of:  MS780-A, MS780-C or MA780 is found, its address is
            ;2209 ;     set to maximum.

            ;2393  .TOC     ENABLE NEXT MS780-E
            ;2394 ;++
            ;2395 ; FUNCTIONAL DESCRIPTION:
            ;2396 ;
            ;2397 ;          This diagnostic will  be able to handle up  to  four  MS780-E units.
            ;2398 ;    They will be tested  separately, according to the TR level at which
            ;2399 ;    they are located,  starting with the one  at the lowest level first.
            ;2400 ;          When  a test has finished  with the first unit, it will have to call
            ;2401 ;    this specific  routine  to see  if any other MS780-E unit is present
            ;2402 ;    on the SBI. If more units are  present, the first one  will be  dis-
            ;2403 ;    abled  by  setting  its  starting  address to maximum, the next unit
            ;2404 ;    will be  enabled  by  setting its starting address to 0 and the test
            ;2405 ;    will be restarted. Subroutine  FIND.MS780E  will  look  on  the  SBI
            ;2406 ;    for  MS780-E/H  subsystems, and will leave their I/O base address in
            ;2407 ;    ID registers 3A through 3D and  a count of the Total number of units
            ;2408 ;    found - 1 in register 3E. In this subroutine the SC register is used
            ;2409 ;    as  a  pointer  to  ID  registers 3A through 3D.

;1808 ;*****************************************************************************
;1809 ;
;1810 ;
;1811 ; MODULE NAME: ESKAR50
;1812 ;
;1813 ; CREATION DATE:  SEPTEMBER 1982
;1814 ; AUTHOR:  DAN GRIGORE
;1815 ;
;1816 ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1817 ;
;1818 ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1819 ;
;1820 ; -  WHAT CHANGE WAS MADE
;1821 ;
;1822 ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1823 ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1824 ;
;1825 ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1826 ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1827 ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1828 ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1829 ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1830 ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1831 ;    ESKAR3C.
;1832 ;
;1833 ; START OF REVISION HISTORY:
;1834 ;
;1835 ; 2.1 Joe Zagarella 29-jul-1985
;1836 ;
;1837 ;  In subroutine 'configure ms780-e/h  the call to  select.cntrlr
;1838 ;  does a write/read to config reg. A, which does not work
;1839 ;  because the SBI at that point is disabled. The insertion
;1840 ;  of a call to 'disable.cache' just before the write/read
;1841 ;  enables the SBI and allows the write/read to take place.
;1842 ;
;1843 ;  Also, in subroutine 'configure ms780-e/h' I added code at
;1844 ;  label cnfg.try.upper to check for an upper controller in case
;1845 ;  it could not find a lower controller
;1846 ;
;1847 ;
;1848 ;*****************************************************************************
;1849
```

```
            ;1850   .PAGE
            ;1851
            ;1852   .TOC  '  MICROTRAP HANDLER'
            ;1853 ;*
            ;1854 ; FOLLOWING ARE THE MICRO TRAP VECTOR ASSIGNMENTS. EACH VECTOR LOADS THE SC
            ;1855 ; WITH A NUMBER, AND LOADS THE Q REGISTER WITH THE CONTENTS OF R[0F].
            ;1856 ; R[0F] IS SETUP BY THE PROGRAM TO INDICATE WHETHER A MICRO TRAP IS EXPECTED
            ;1857 ; THIS IS DONE BY SETTING THE BIT IN R[0F] THAT CORRESPONDS TO THE NUMBER
            ;1858 ; THAT IS LOADED INTO THE SC BY THAT PARTICULAR MICRO TRAP.
            ;1859 ;
            ;1860 ; FOR EXAMPLE: IF A TEST EXPECTED A 'TB MISS' MICRO TRAP IT WOULD SET BIT
            ;1861 ; 6 IN SCRATCH PAD R[0F]. WHEN THE TRAP OCCURRED, THE TRAP CATCHER
            ;1862 ; ROUTINE WOULD SENSE THAT THE TRAP WAS EXPECTED AND CLEAR BIT 6 IN
            ;1863 ; R[0F] AND DO A RETURN0.
            ;1864 ;
            ;1865 ; IF THE BIT FOR THE PARTICULAR TRAP IS NOT SET IN R[0F], THE TRAP ROUTINE
            ;1866 ; READS THE ERROR REGISTERS, SAVES THEM FOR TYPEOUT, AND MAKES AN ERROR CALL
            ;1867 ; TO THE CONSOLE.
            ;1868 ;
            ;1869 ; THE JUMP FIELDS OF ALL THE TRAP VECTORS EXCEPT THE CONTROL STORE PARITY
            ;1870 ; ERROR VECTOR, POINT TO A ROUTINE THAT EXECUTES A RETURN0 IF THE TRAP WAS
            ;1871 ; EXPECTED. THE CS PARITY ERROR VECTOR POINTS TO A ROUTINE THAT EXECUTES A
            ;1872 ; RETURN1 IF THE TRAP WAS EXPECTED SINCE THE ADDRESS THAT WAS PUSHED ON THE
            ;1873 ; STACK IS THE ADDRESS OF THE MICRO WORD WITH BAD PARITY.

            ;1946 ; FUNCTIONAL DESCRIPTION:
            ;1947 ;
            ;1948 ; This routine Initializes the following registers:
            ;1949 ;  PSL    to 1F
            ;1950 ;  CES    to 0
            ;1951 ;  ACC.CS    to disable accellerator
            ;1952 ;  SIR    to 0
            ;1953 ;  CLK.CS    to stop interval timer
            ;1954 ;  TBER0    to disable the TB
            ;1955 ;  SBI.MAINT to     0
            ;1956 ;  SBI.ERR    to 0
            ;1957 ;  FAULT    to 0
            ;1958 ;  COMP    to 0
            ;1959 ;  RC[0E]    to  0
            ;1960 ;  R[0F]    to 0
            ;1961 ; It also performs an SBI UNJAM and disables the CACHE.
            ;1962 ; A SCOPE call is then made to the Monitor.
            ;1963 ;

            ;2509  .TOC     Find MS780-E Memory
            ;2510 ;++
            ;2511 ; FUNCTIONAL DESCRIPTION:
            ;2512 ;
            ;2513 ;          The diagnostic is designed to handle up to 4 (four)
            ;2514 ;     MS780-E/H's on the 780 SBI.  This routine looks at all TR levels
            ;2515 ;     for a MS780-E memory unit.  Upon return, ID registers 3A through
            ;2516 ;     3D will hold the I/O base address of the MS780-E subsystems found
            ;2517 ;     on the SBI, and ID Register 3E will hold the Total number of
            ;2518 ;     MS780-E/H's found minus one.  Also, it is to be noted that the
            ;2519 ;     first MS780-E found will have its starting address set to 0
            ;2520 ;     (zero).
            ;2521 ;     All the other MS780-E/H's found will have their starting address
            ;2522 ;     set to all ones.  Subroutine ENABLE.NEXT.MS780E will look at ID
            ;2523 ;     Reg 3E to decide if there are any more MS780-E and will take
            ;2524 ;     apropriate action.  Register RC[0E] is used as a pointer to the
            ;2525 ;     current MS780-E unit under test.
            ;2526 ;     If any of:  MS780-A, MS780-C or MA780 is found, its address is
            ;2527 ;     set to maximum.
            ;2528 ;

            ;2837  .PAGE
            ;2838  .TOC     ENABLE NEXT MS780-E'
            ;2839 ;++
            ;2840 ; FUNCTIONAL DESCRIPTION:
            ;2841 ;
            ;2842 ;           This diagnostic will  be able to handle up  to  four  MS780-E units.
            ;2843 ;     They will be tested  separately, according to the TR level at which
            ;2844 ;     they are located,  starting with the one  at the lowest level first.
            ;2845 ;           When  a test has finished  with the first unit, it will have to ca
            ;2846 ;     this specific  routine  to see  if any other MS780-E unit is present
            ;2847 ;     on the SBI. If more units are  present, the first one  will be  dis-
            ;2848 ;     abled  by  setting  its  starting  address to maximum, the next unit
            ;2849 ;     will be  enabled  by  setting its starting address to 0 and the test
            ;2850 ;     will be restarted. Subroutine  FIND.MS780E  will  look  on  the  SBI
            ;2851 ;     for  MS780-E/H  subsystems, and will leave their I/O base address in
            ;2852 ;     ID registers 3A through 3D and  a count of the Total number of units
            ;2853 ;     found - 1 in register 3E. In this subroutine the SC register is used
            ;2854 ;     as  a  pointer  to  ID  registers 3A through 3D.
            ;2855 ;

;1808 ;*****************************************************************************
;1809 ;
;1810 ;
;1811 ; MODULE NAME: ESKAR51
;1812 ;
;1813 ; CREATION DATE:  SEPTEMBER 1982
;1814 ; AUTHOR:  DAN GRIGORE
;1815 ;
;1816 ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1817 ;
;1818 ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1819 ;
;1820 ; -  WHAT CHANGE WAS MADE
;1821 ;
;1822 ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1823 ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1824 ;
;1825 ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1826 ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1827 ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1828 ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1829 ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1830 ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1831 ;    ESKAR3C.
;1832 ;
;1833 ; START OF REVISION HISTORY:
;1834 ;
;1835 ; 2.1 Joe Zagarella 11-jul-1985
;1836 ;
;1837 ;  With ms780-e/h configured with upper controller
;1838 ;  only, all tests in this section would fail at
;1839 ;  subroutine  configure ms780-e/h  because this
;1840 ;  subroutine only checked for the lower controller.
;1841 ;  Added code at label  try.upper  to check for upper
;1842 ;  controller.
;1843 ;
;1844 ;
;1845 ;
;1846 ;*****************************************************************************
;1847
```

```
            ;1848  .PAGE
            ;1849  .TOC  MICROTRAP HANDLER
            ;1850 ;*
            ;1851 ; FOLLOWING ARE THE MICRO TRAP VECTOR ASSIGNMENTS. EACH VECTOR LOADS THE SC
            ;1852 ; WITH A NUMBER, AND LOADS THE Q REGISTER WITH THE CONTENTS OF R[0F].
            ;1853 ; R[0F] IS SETUP BY THE PROGRAM TO INDICATE WHETHER A MICRO TRAP IS EXPECTED
            ;1854 ; THIS IS DONE BY SETTING THE BIT IN R[0F] THAT CORRESPONDS TO THE NUMBER
            ;1855 ; THAT IS LOADED INTO THE SC BY THAT PARTICULAR MICRO TRAP.
            ;1856 ;
            ;1857 ; FOR EXAMPLE: IF A TEST EXPECTED A  TB MISS  MICRO TRAP IT WOULD SET BIT
            ;1858 ; 6 IN SCRATCH PAD R[0F]. WHEN THE TRAP OCCURRED, THE TRAP CATCHER
            ;1859 ; ROUTINE WOULD SENSE THAT THE TRAP WAS EXPECTED AND CLEAR BIT 6 IN
            ;1860 ; R[0F] AND DO A RETURN0.
            ;1861 ;
            ;1862 ; IF THE BIT FOR THE PARTICULAR TRAP IS NOT SET IN R[0F], THE TRAP ROUTINE
            ;1863 ; READS THE ERROR REGISTERS, SAVES THEM FOR TYPEOUT, AND MAKES AN ERROR CALL
            ;1864 ; TO THE CONSOLE.
            ;1865 ;
            ;1866 ; THE JUMP FIELDS OF ALL THE TRAP VECTORS EXCEPT THE CONTROL STORE PARITY
            ;1867 ; ERROR VECTOR, POINT TO A ROUTINE THAT EXECUTES A RETURN0 IF THE TRAP WAS
            ;1868 ; EXPECTED. THE CS PARITY ERROR VECTOR POINTS TO A ROUTINE THAT EXECUTES A
            ;1869 ; RETURN1 IF THE TRAP WAS EXPECTED SINCE THE ADDRESS THAT WAS PUSHED ON THE
            ;1870 ; STACK IS THE ADDRESS OF THE MICRO WORD WITH BAD PARITY.
            ;1871 ;-

            ;1942 ;++
            ;1943 ; FUNCTIONAL DESCRIPTION:
            ;1944 ;
            ;1945 ; This routine Initializes the following registers:
            ;1946 ;  PSL    to 1F
            ;1947 ;  CES    to 0
            ;1948 ;  ACC.CS    to disable accellerator
            ;1949 ;  SIR    to 0
            ;1950 ;  CLK.CS    to stop interval timer
            ;1951 ;  TBER0    to disable the TB
            ;1952 ;  SBI.MAINT to    0
            ;1953 ;  SBI.ERR    to 0
            ;1954 ;  FAULT    to 0
            ;1955 ;  COMP    to 0
            ;1956 ;  RC[0E]    to  0
            ;1957 ;  R[0F]    to 0
            ;1958 ; It also performs an SBI UNJAM and disables the CACHE.
            ;1959 ; A SCOPE call is then made to the Monitor.

            ;2267  .TOC "   Find MS780-E Memory"
            ;2268 ;++
            ;2269 ; FUNCTIONAL DESCRIPTION:
            ;2270 ;
            ;2271 ;          The diagnostic is designed to handle up to 4 (four)
            ;2272 ;     MS780-E/H's on the 780 SBI. This routine looks at all TR levels
            ;2273 ;     for a MS780-E memory unit.  Upon return, ID registers 3A through
            ;2274 ;     3D will hold the I/O base address of the MS780-E subsystems found
            ;2275 ;     on the SBI, and ID Register 3E will hold the Total number of
            ;2276 ;     MS780-E/H's found minus one. Also, it is to be noted that the
            ;2277 ;     first MS780-E found will have its starting address set to 0
            ;2278 ;     (zero).
            ;2279 ;     All the other MS780-E/H's found will have their starting address
            ;2280 ;     set to all ones. Subroutine ENABLE.NEXT.MS780E will look at ID
            ;2281 ;     Reg 3E to decide if there are any more MS780-E and will take
            ;2282 ;     apropriate action.  Register RC[0E] is used as a pointer to the
            ;2283 ;     current MS780-E unit under test.
            ;2284 ;     If any of: MS780-A, MS780-C or MA780 is found, its address is
            ;2285 ;     set to maximum.
            ;2286 ;

            ;2586  .PAGE
            ;2587  .TOC     ENABLE NEXT MS780-E
            ;2588 ;**
            ;2589 ; FUNCTIONAL DESCRIPTION:
            ;2590 ;
            ;2591 ;          This diagnostic will  be able to handle up  to  four  MS780-E units.
            ;2592 ;    They will be tested  separately, according to the TR level at which
            ;2593 ;    they are located,  starting with the one  at the lowest level first.
            ;2594 ;          When  a test has finished  with the first unit, it will have to call
            ;2595 ;    this specific  routine  to see  if any other MS780-E unit is present
            ;2596 ;    on the SBI. If more units are  present, the first one  will be  dis-
            ;2597 ;    abled  by  setting  its  starting  address to maximum, the next unit
            ;2598 ;    will be  enabled  by  setting its starting address to 0 and the test
            ;2599 ;    will be restarted. Subroutine  FIND.MS780E  will  look  on  the  SBI
            ;2600 ;    for  MS780-E/H  subsystems, and will leave their I/O base address in
            ;2601 ;    ID registers 3A through 3D and  a count of the Total number of units
            ;2602 ;    found - 1 in register 3E. In this subroutine the SC register is used
            ;2603 ;    as  a  pointer  to  ID  registers 3A through 3D.

            ;2760  .TOC "   WAIT REFRESH SUBROUTINE"
            ;2761 ;*****************************************************************
            ;2762 ;++
            ;2763 ;
            ;2764 ; Functional Description:
            ;2765 ; ----------------------
            ;2766 ;
            ;2767 ; This subroutine provides the means of synchronizing the
            ;2768 ; diagnostic with the end of a refresh cycle on a MS780-E/H
            ;2769 ; memory.  It should be used by all the tests in which
            ;2770 ; timing is critical and delays due to refresh could
            ;2771 ; introduce false errors.
            ;2772 ;
            ;2773 ; Calling Constraint: =0
            ;2774 ; ------------------
            ;2775 ;
            ;2776 ;
            ;2777 ; Inputs:
            ;2778 ; ------
            ;2779 ;
            ;2780 ; R[0E] must hold the CNFG Reg B Address
             2781 ;
            ;2782 ; NOTE: This is slightly different than the similar subroutine
            ;2783 ;  used in ESKAR42 and ESKAR43.  This change is necessary
            ;2784 ;  due to different register assignments in these sections.
            ;2785 ;
            ;2786 ;
            ;2787 ; Outputs:
            ;2788 ; -------
            ;2789 ;
            ;2790 ; RETURN1 at the end of a refresh cycle.
            ;2791 ;
            ;2792 ;
            ;2793 ; Side Effects:
            ;2794 ; ------------
            ;2795 ;
            ;2796 ; The contents of the following registers will be lost:
            ;2797 ;
            ;2798 ; D, SC, CNFG Reg B
            ;2799 ;

;1808 ;*****************************************************************************
;1809 ;
;1810 ;
;1811 ; MODULE NAME: ESKAR52
;1812 ;
;1813 ; CREATION DATE:  SEPTEMBER 1982
;1814 ; AUTHOR:  DAN GRIGORE
;1815 ;
;1816 ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1817 ;
;1818 ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1819 ;
;1820 ; -  WHAT CHANGE WAS MADE
;1821 ;
;1822 ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1823 ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1824 ;
;1825 ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1826 ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1827 ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1828 ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1829 ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1830 ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1831 ;    ESKAR3C.
;1832 ;
;1833 ; START OF REVISION HISTORY:
;1834 ;
;1835 ; MODIFIED BY:
;1836 ;
;1837 ;  1.1 March 10, 1983  Paul Hakala
;1838 ;   Modified the GET.MEMORY.SIZE routine to calculate
;1839 ;   the correct memory address when 256k ram chips are
;1840 ;   present.
;1841 ;
;1842 ;
;1843 ;
;1844 ;
;1845 ;
;1846 ;*****************************************************************************

            ;1849
            ;1850  .TOC   Micro Trap Handler and LSI-11 Support Routines'
            ;1851  .TOC '    Micro Trap Handler'
            ;1852 ;++
            ;1853 ; FUNCTIONAL DESCRIPTION:
            ;1854 ;
            ;1855 ; This routine is responsible for 'catching' micro-traps
            ;1856 ; and reporting unexpected traps to the Monitor. Register R[0F]
            ;1857 ; contains the Trap-Expected Mask. If the specified bit is set in
            ;1858 ; the mask, the bit is cleared and a RETURN0 is made otherwise,
            ;1859 ; an error call is made.
            ;1860 ;
            ;1861 ; INPUT PARAMETERS:
            ;1862 ;
            ;1863 ; R[0F] - Expected Trap Mask
            ;1864 ;  Trap Code Function
            ;1865 ;  ---------      --------
            ;1866 ;       0  System Init
            ;1867 ;       1  Data Unaligned

;2218  .PAGE
;2219  .TOC "    START TEST"
;2220 ;*************************************************************
;2221 ;**
;2222 ;
;2223 ; Functional Description:
;2224 ; ----------------------
;2225 ;
;2226 ;         This subroutine will be called by all tests that  check  the
;2227 ;    controllers,  or  those  tests  that  have  to switch between the
;2228 ;    controllers when executing.   Its  main  functions  are:   select
;2229 ;    both  controllers  on the MS780-E/H SBI Interface and execute the
;2230 ;    test that called it, call out an error  if  neither  one  of  the
;2231 ;    controllers can be configured properly, if all the controllers on
;2232 ;    a MS780-E/H were configured and tested, it should select the next
;2233 ;    MS780-E/H on the SBI and repeat the above sequence.
;2234 ;    A test making use of this  subroutine  should  be  configured  as
;2235 ;    follows:
;2236 ;
;2237 ;
;2238 ;       Begin TEST.XX
;2239 ;       :
;2240 ;       :   Call NEWTST
;2241 ;       :   Call FIND.MS780E
;2242 ;       :   IF No MS780-E's on the SBI
;2243 ;       :     THEN
;2244 ;       :         Skip to End of TEST.XX
;2245 ;       :     ELSE
;2246 ;       :
;2247 ;       : RESTART.TEST.XX:
;2248 ;       :
;2249 ;       :   Call START TEST
;2250 ;       :   IF Return1 from START.TEST
;2251 ;       :     THEN
;2252 ;       :         Skip to End of TEST.XX
;2253 ;       :     ELSE.
;2254 ;       :
;2255 ;       ~
;2256 ;       ~
;2257 ;       :
;2258 ;       :   Body of TEST.XX
;2259 ;       :
;2260 ;       ~
;2261 ;       ~
;2262 ;       :   Jump RESTART.TEST.XX
;2263 ;       :
;2264 ;       End TEST.XX
;2265 ;
;2266 ;
;2267 ;         This subroutine makes use of a pointer  in  ID  Register  39
;2268 ;    (Temporary  Register  9)  to   remember   at  which point control
;2269 ;    should be passed when the subroutine is called a second, third or
;2270 ;    fourth  time, depending on the number of MS780-E's on the SBI and
;2271 ;    the numbers of controllers on each.  (Note:  Temporary Register 9
;2272 ;    will  be  cleared  by  the  NEWTST subroutine ) The pointer in ID
```

```
;2273 ;    Register 39 can be interpreted as follows:
;2274 ;
;2275 ;     b00   -   Value that ID Reg 39 should hold when the subroutine is
;2276 ;               called the first time.  When this code is encountered
;2277 ;               this subroutine will try to select the lower controller.
;2278 ;               If the lower controller is misconfigured, the pointer in
;2279 ;               ID Reg 39  is changed to b01 (See below) and the subroutine
;2280 ;               is re-entered.
;2281 ;               If, however there is no misconfiguration, the value in
;2282 ;               ID Reg 39 is changed to b10 and a Return2 is made to the
;2283 ;               calling test.
;2284 ;
;2285 ;    b01  -     This value signifies that an attempt at configuring the
;2286 ;               lower controller failed, and the subroutine will attempt
;2287 ;               to select the upper controller.
;2288 ;               If the upper controller is also misconfigured execution
;2289 ;               stops with a call to ERROR1.
;2290 ;               If there is no misconfiguration on this controller, then
;2291 ;               the code in ID Reg 39 is changed to b11 and a Return2 is
;2292 ;               made to the calling test.
;2293 ;
;2294 ;    b10  -     This value signifies that the lower controller was selected
;2295 ;               previously and the test was executed once.  If the
;2296 ;               subroutine is entered with this code in ID Reg 39, ID Reg
;2297 ;               39 is loaded with b11 and an attempt is made to select the
;2298 ;               upper controller.
;2299 ;               If there is a misconfiguration on this controller, this
;2300 ;               subroutine is just re-entered.
;2301 ;               Otherwise, a Return2 will be made to the calling test.
;2302 ;
;2303 ;     b11   -   This code identifies the cases in which the test has
;2304 ;               been executed at least once (i.e., at least one of the
;2305 ;               controllers on the MS780-E unit under test could be
;2306 ;               configured properly).  When this code is detected the
;2307 ;               subroutine clears ID Reg 39 and makes a call to
;2308 ;               ENABLE.NEXT.MS780E.  If all MS780-E units have been
;2309 ;               tested then the subroutine executes a Return1.
;2310 ;               Otherwise the subroutine is re-entered.
;2311 ;
;2312 ;

            ;3039  .TOC "   ENABLE NEXT MS780-E"
            ;3040 ;++
            ;3041 ; FUNCTIONAL DESCRIPTION:
            ;3042 ;
            ;3043 ;          This diagnostic will  be able to handle up  to  four  MS780-E units.
            ;3044 ;    They will be tested  separately, according to the TR level at which
            ;3045 ;    they are located,  starting with the one  at the lowest level first.
            ;3046 ;          When  a test has finished  with the first unit, it will have to call
            ;3047 ;    this specific  routine  to see  if any other MS780-E unit is present
            ;3048 ;    on the SBI. If more units are  present, the first one  will be  dis-
            ;3049 ;    abled  by  setting  its  starting  address to maximum, the next unit
            ;3050 ;    will be  enabled  by  setting its starting address to 0 and the test
            ;3051 ;    will be restarted. Subroutine  FIND.MS780E  will  look  on  the  SBI
            ;3052 ;    for  MS780-E/H  subsystems, and will leave their I/O base address in
            ;3053 ;    ID registers 3A through 3D and  a count of the Total number of units
            ;3054 ;    found - 1 in register 3E. In this subroutine the SC register is used
            ;3055 ;    as  a  pointer  to  ID  registers 3A through 3D.

;3661   .PAGE  TEST 1F7 SINGLE BIT ERROR ON MASKED WRITES
;3662 ;*************************************************************
;3663 ;+++
;3664 ;
;3665 ; Functional Description:
;3666 ; ---------------------
;3667 ;
;3668 ; This test forces CRD errors on Masked Writes, and verifies whether the
;3669 ; error is detected and properly corrected.  The following cases will be
;3670 ; tested:
;3671 ;
;3672 ;    i.  Error in byte 3
;3673 ;   ii.  Error in byte 2
;3674 ;  iii.  Error in byte 1
;3675 ;   iv.  Error in byte 0
;3676 ;    v.  Error in check bits
;3677 ;   vi.  Error in byte 0
;3678 ;
;3679 ; Cases i through iv force errors in bytes that are not being written
;3680 ; with new data and a check is made to see that the data was corrected.
;3681 ; Case v forces an error in the check bits.  It is expected that the data
;3682 ; will not be modified, while the check bits will be corrected when the
;3683 ; data is written to the array.  Finally, case vi forces a CRD error in
;3684 ; one byte that should be written over with new data.  A read of the
;3685 ; array will assure that the byte was indeed written over.  The above
;3686 ; cases will make up the subtests below.
;3687 ;
;3688 ;   [Subtest 1:]
;3689 ;
;3690 ; Location 0 is initialize to x01000000, the substitute ECC bits are set
;3691 ; to xC (for data of all zeroes) in Diagnostic Mode 2 a write is done to
;3692 ; bytes 0, 1, and 2, thus forcing the CRD error.  On a subsequent
;3693 ; extended read of the location in Diagnostic Mode 3 it is expected that
;3694 ; the data returned from the array will be all zeroes.
;3695 ;
;3696 ;   [Subtest 2:]
;3697 ;
;3698 ; In this case location 0 is initialized to x10000 and a write is done to
;3699 ; bytes 0 and 1 (everything else will be the same as in the previous
;3700 ; subtest, ie., setting up the diagnostic modes and the data returned
;3701 ; from memory).
;3702 ;
;3703 ;   [Subtest 3:]
;3704 ;
;3705 ; This subtest initializes location 0 to x100 and a write is done to byte
;3706 ; 0.  Diagnostic modes and expected data returned from the memory are the
;3707 ; save as in previous subtests.
;3708 ;
;3709 ;   [Subtest 4:]
;3710 ;
;3711 ; Location 0 is initialized to x01 and a write is done to bytes 1, 2, and
;3712 ; 3.
;3713 ;
;3714 ;   [Subtest 5:]
;3715 ;
```

```
;3716 ; This subtest initializes the array location 0 too 0, sets the substi-
;3717 ; tute ECC bits to x0D and in Diagnostic Mode 2 executes a masked write
;3718 ; to byte 0.  It is expected that the data on the array was not modified
;3719 ; (ie., it is still 0) and that the check bits on the array will be for
;3720 ; data of all 0's.
;3721 ;
;3722 ;   [Subtest 6:]
;3723 ;
;3724 ; In this subtest location 0 will be initialized to x03.  The substitute
;3725 ; ECC bits are set for data of one (x43), and in Diagnostic mode 2 byte 0
;3726 ; will be written with data of 0.  this will force a CRD error in byte 0
;3727 ; but the new data should still be written to byte 0.

;4107  .PAGE  TEST 1F8 DOUBLE BIT ERROR ON MASKED WRITES
;4108 ;*************************************************************
;4109 ;***
;4110 ;
;4111 ; Functional Description:
;4112 ; ----------------------
;4113 ;
;4114 ; This test starts by initializing location 0 with some data.  A RDS
;4115 ; error is forced during masked writes to memory.  It is expected that:
;4116 ; if the mask is not all ones (ie., not all the bytes are written to the
;4117 ; array) then the write is aborted and thus there should be no change in
;4118 ; the initial data.  If, however, the mask is all ones (a normal longword
;4119 ; write to memory) the cycle should not be aborted.
;4120 ;
;4121 ;   [Subtest 1:]
;4122 ;
;4123 ; Array location 0 is intialized to x3, the substitute ECC bits are set
;4124 ; for data of all zeroes (xC) and in Diagnostic Mode 2 a write with data
;4125 ; of 0's is done to byte 0 (of location 0).  It is expected that the
;4126 ; write is aborted and the data on the array is unchanged.  This will be
;4127 ; done only for one of the four bytes in a longword, since the function-
;4128 ; ality of the RDS detection logic is previously tested.
;4129 ;
;4130 ;   [Subtest 2:]
;4131 ;
;4132 ; This subtest is similar to the previous one.  The difference is that
;4133 ; after setting the ECC substitute bits and the diagnostic mode, a
;4134 ; longword write will be done to location 0.  It is expected that the
;4135 ; write does not abort.
;4136 ;

;4310  .PAGE 'TEST 1F9 QUICK VERIFY ARRAY DATA INTEGRITY TEST
;4311 ;************************************************************
;4312 ;***
;4313 ;
;4314 ; Functional Description:
;4315 ; ----------------------
;4316 ;
;4317 ; This test is a Quick Verify test of the data integrity of the array.
;4318 ;
;4319 ; PLEASE NOTE:  This test may NOT find all CRD/RDS error due to 'hard
;4320 ;       failures .
;4321 ;
;4322 ; The Quick verify test runs a marching pattern test on the arrays, and
;4323 ; is intended to detect possible addressing errors and interference
;4324 ; between cells within the same RAM chip.  The test will start with
;4325 ; Board 0, Bank 0, Location 0 and will move up to higher addresses test-
;4326 ; ing one Bank at a time.  When all four banks on a board have been
;4327 ; tested, the next Board will be accessed. If a Time Out micro trap
;4328 ; occurs or if the data on the array is not equal to the expected and
;4329 ;       a RDS micro trap was generated (thus indicating a possible addressing
;4330 ;       error) the test will stop with an error call.
;4331 ;
;4332 ;
;4333 ; Logic Description:
;4334 ; -----------------
;4335 ;  N/A
;4336 ;
;4337 ;
;4338 ; Error Logout:
;4339 ; ------------

;1808 ;*****************************************************************************
;1809 ;
;1810 ;
;1811 ; MODULE NAME: ESKAR53
;1812 ;
;1813 ; CREATION DATE:  SEPTEMBER 1982
;1814 ; AUTHOR:  DAN GRIGORE
;1815 ;
;1816 ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1817 ;
;1818 ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1819 ;
;1820 ; -  WHAT CHANGE WAS MADE
;1821 ;
;1822 ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1823 ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1824 ;
;1825 ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1826 ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1827 ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1828 ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1829 ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1830 ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1831 ;    ESKAR3C.
;1832 ;
;1833 ; START OF REVISION HISTORY:
;1834 ;
;1835 ; MODIFIED BY:
;1836 ;
;1837 ;  1.1 March 10, 1983  Paul Hakala
;1838 ;   Modified the GET.MEMORY.SIZE routine to calculate
;1839 ;   the correct memory address when 256k ram chips are
;1840 ;   present.
;1841 ;
;1842 ;

            ;1848  .PAGE
            ;1849
            ;1850  .TOC  ' MICRO TRAP HANDLER AND LSI-MONITER CALL ROUTINES'
            ;1851 ;*
            ;1852 ; FOLLOWING ARE THE MICRO TRAP VECTOR ASSIGNMENTS. EACH VECTOR LOADS THE SC
            ;1853 ; WITH A NUMBER, AND LOADS THE D REGISTER WITH THE CONTENTS OF R[0F].
            ;1854 ; R[0F] IS SETUP BY THE PROGRAM TO INDICATE WHETHER A MICRO TRAP IS EXPECTED
            ;1855 ; THIS IS DONE BY SETTING THE BIT IN R[0F] THAT CORRESPONDS TO THE NUMBER
            ;1856 ; THAT IS LOADED INTO THE SC BY THAT PARTICULAR MICRO TRAP.
            ;1857 ;
            ;1858 ; FOR EXAMPLE: IF A TEST EXPECTED A 'TB MISS" MICRO TRAP IT WOULD SET BIT
            ;1859 ; 6 IN SCRATCH PAD R[0F]. WHEN THE TRAP OCCURRED, THE TRAP CATCHER
            ;1860 ; ROUTINE WOULD SENSE THAT THE TRAP WAS EXPECTED AND CLEAR BIT 6 IN
            ;1861 ; R[0F] AND DO A RETURN0.
            ;1862 ;
            ;1863 ; IF THE BIT FOR THE PARTICULAR TRAP IS NOT SET IN R[0F], THE TRAP ROUTINE
            ;1864 ; READS THE ERROR REGISTERS, SAVES THEM FOR TYPEOUT, AND MAKES AN ERROR CALL
            ;1865 ; TO THE CONSOLE.
            ;1866 ;
            ;1867 ;-

            ;1926 ;**
            ;1927 ; FUNCTIONAL DESCRIPTION:
            ;1928 ;
            ;1929 ; This routine Initializes the following registers:
            ;1930 ;  PSL    to 1F
            ;1931 ;  CES    to 0
            ;1932 ;  ACC.CS    to disable accellerator
            ;1933 ;  SIR    to 0
            ;1934 ;  CLK.CS    to stop interval timer
            ;1935 ;  TBER0    to disable the TB
            ;1936 ;  SBI.MAINT to     0
            ;1937 ;  SBI.ERR    to 0
            ;1938 ;  FAULT    to 0
            ;1939 ;  COMP    to 0
            ;1940 ;  RC[0E]    to  0
            ;1941 ;  R[0F]    to 0
            ;1942 ; It also performs an SBI UNJAM and disables the CACHE.
            ;1943 ; A SCOPE call is then made to the Monitor.
            ;1944 ;
            ;1945 ; CALLING CONSTRAINT:

            ;3051  .TOC "    Find MS780-E Memory"
            ;3052 ;++
            ;3053 ; FUNCTIONAL DESCRIPTION:
            ;3054 ;
            ;3055 ;          The diagnostic is designed to handle up to 4 (four)
            ;3056 ;     MS780-E/H's on the 780 SBI. This routine looks at all TR levels
            ;3057 ;     for a MS780-E memory unit.  Upon return, ID registers 3A through
            ;3058 ;     3D will hold the I/O base address of the MS780-E subsystems found
            ;3059 ;     on the SBI, and ID Register 3E will hold the Total number of
            ;3060 ;     MS780-E/H's found minus one. Also, it is to be noted that the
            ;3061 ;     first MS780-E found will have its starting address set to 0
            ;3062 ;     (zero).
            ;3063 ;     All the other MS780-E/H's found will have their starting address
            ;3064 ;     set to all ones. Subroutine ENABLE.NEXT.MS780E will look at ID
            ;3065 ;     Reg 3E to decide if there are any more MS780-E and will take
            ;3066 ;     apropriate action.  Register RC[0E] is used as a pointer to the
            ;3067 ;     current MS780-E unit under test.
            ;3068 ;     If any of: MS780-A, MS780-C or MA780 is found, its address is
            ;3069 ;     set to maximum.

            ;3389  .PAGE
            ;3390  .TOC     ENABLE NEXT MS780-E
            ;3391 ;++
            ;3392 ; FUNCTIONAL DESCRIPTION:
            ;3393 ;
            ;3394 ;          This diagnostic will  be able to handle up  to  four  MS780-E units.
            ;3395 ;    They will be tested  separately, according to the TR level at which
            ;3396 ;    they are located,  starting with the one  at the lowest level first.
            ;3397 ;          When  a test has finished  with the first unit, it will have to call
            ;3398 ;    this specific  routine  to see  if any other MS780-E unit is present
            ;3399 ;    on the SBI. If more units are  present, the first one  will be  dis-
            ;3400 ;    abled  by  setting  its  starting  address to maximum, the next unit
            ;3401 ;    will be  enabled  by  setting its starting address to 0 and the test
            ;3402 ;    will be restarted. Subroutine  FIND.MS780E  will  look  on  the  SBI
            ;3403 ;    for  MS780-E/H  subsystems, and will leave their I/O base address in
            ;3404 ;    ID registers 3A through 3D and  a count of the Total number of units
            ;3405 ;    found - 1 in register 3E. In this subroutine the SC register is used
            ;3406 ;    as  a  pointer  to  ID  registers 3A through 3D.
            ;3407 ;

            ;3575  .TOC "   64K OR 256K CHIPS"
            ;3576 ;*****************************************************
            ;3577 ;**
            ;3578 ;
            ;3579 ; Functional Description:
            ;3580 ; ----------------------
            ;3581 ; This subroutine is used to find the type of chips
            ;3582 ; on the MS780-E/H arrays.  The RETURN modes are as
            ;3583 ; follows:
            ;3584 ;
            ;3585 ; RETURN1 = Error. Mixed 64K and 256K arrays
            ;3586 ;
            ;3587 ; RETURN2 = 64K chips on the array
            ;3588 ;
            ;3589 ; RETURN3 = 256K chips on the array
            ;3590 ;
            ;3591 ; Calling Constraint: =00
            ;3592 ; ------------------
            ;3593 ;
            ;3594 ;
            ;3595 ; Inputs:
            ;3596 ; ------
            ;3597 ;
            ;3598 ; RC[0E] must hold the I/O base address of the MS780-E/H
            ;3599 ; currently under test
            ;3600 ;
            ;3601 ; Outputs:
            ;3602 ; -------
            ;3603 ;
            ;3604 ; NO specific outputs. (See RETURN modes above)
            ;3605 ;
            ;3606 ;
            ;3607 ; Side Effects:
            ;3608 ; ------------
            ;3609 ;
            ;3610 ; The contents of the following registers will be lost:
            ;3611 ;
            ;3612 ; D
            ;3613 ;
            ;3614 ;--

;3631 ;
;3632 ; SBI/CACHE MISCELLANEOUS TESTS
;3633 ;
;3634 ; TEST DESCRIPTION
;3635 ;
;3636 ; THIS TEST CHECK THAT ON READ MISSES THE SBI (SBH,SBL)
;3637 ; DRIVE THE PROPER ADDRESS ON TO THE PA BUS.  THE TEST
;3638 ; CHECKS ALL ADDRESS LINES (BYTE ADDRESS BIT 2 TO 28).  THE LINES
;3639 ; ARE CHECKED TO SEE THAT THEY ARE NOT STUCK AND ARE
;3640 ; INDEPENDENT.  THE TEST USES THE HIT/MISS LOGIC TO
;3641 ; SEE THAT THE INTERFACE DRIVES THE CORRECT ADDRESS TO THE
;3642 ; MEMORY SPACE, AND THE OTHER TEST CHECKS THE ADDRESS
;3643 ; LINES OUTSIDE OF VALID MEMORY SPACE. ALSO CHECKED IS STALL IN THE
;3644 ; PRESENTS OF CACHE PARITY ERRORS.
;3645 ;
;3646 ;
;3647 ; SUBTEST 1 TEST ALL ADDRESS LINES WITHIN VALID MEMORY
;3648 ;   SPACE ARE INDEPENDENT.  SETS STARTING ADDRESS
;3649 ;   TO ZERO AND RUNS THE TEST.
;3650 ;
;3651 ; SUBTEST 2 TEST THE ADDRESS LINES ABOVE VALID
;3652 ;   MEMORY SPACE.  THE MEMORY STARTING ADDRESS
;3653 ;   IS DISPLACE TO THE BIT UNDER TEST AND
;3654 ;   THE TEST IS RUN.
;3655 ;
;3656 ; SUBTEST 3 CHECK NO STALL(I.E. NO SBI CYCLES) WHEN A READ
;3657 ;   MISS AND CACHE PARITY EREOS EXSISTS(BOTH GROUPS).
;3658 ;
;3659 ; SUBTEST 4 CHECK STALL( I.E. SBI CYCLES) WHEN A READ MISS
;3660 ;   OCCURES WITH A FORCE MISS AND PARITY ERRORS(BOTH
;3661 ;   GROUPS).
;3662 ;
;3663 ;

;4160  .PAGE "TEST 1FC ROM CHECKSUM TEST"
;4161 ;*************************************************************
;4162 ;+++
;4163 ;
;4164 ; Functional Description:
;4165 ; ---------------------
;4166 ;
;4167 ; This test  checks the  bootstrap ROMs on the M8213
;4168 ; or the M8376 boards (whichever are found depending
;4169 ; on the System configuration.
;4170 ; The following checks will be done:
;4171 ;
;4172 ; - The  first  location  will  be  read  and  it is
;4173 ;   expected to return the following data: x071159D4
;4174 ;   (this  is  valid  for  both  the MS780-C and the
;4175 ;   MS780-E ROMs)
;4176 ;
;4177 ; - Read a ROM location whose contents should be 0.
;4178 ;   This location is x20003800 for both the MS780-C
;4179 ;   and the MS780-E)
;4180 ;
;4181 ; - OR together the  contents of two locations whose
;4182 ;   result will be all ones.
;4183 ;   These locations are for the MS780-C:
;4184 ;
;4185 ;  20003010 which contains 51FFFFFF
;4186 ;    and
;4187 ;  2000331C which contains EFDE5212
;4188 ;
;4189 ;  (This data is  valid as of: 12-5-78 and it
;4190 ;   may change with future ECO's)
;4191 ;
;4192 ;   For the MS780-E the two locations are:
;4193 ;
;4194 ;  200030AC which contains A5A5A5A5
;4195 ;    and
;4196 ;  200030B0 which contains 5A5A5A5A
;4197 ;
;4198 ;  (This data is valid as of: 8-26-82 and it
;4199 ;   may also change with future ECO's)
;4200 ;
;4201 ; - Add the 32 bit CHECKSUM of the data in the ROMs.
;4202 ;   The expected checksum for the MS780-C ROMs is:
;4203 ;
;4204 ;  25CCD7E5 (As of 12-1-78 and it may
;4205 ;     change with future ECO's)
;4206 ;
;4207 ;   The expected checksum for the MS780-E ROMs is:
;4208 ;
;4209 ;  0E2734EA (As of 7-22-82 and it may
;4210 ;     also  change with future
;4211 ;     ECO's.   Note:  for  the
;4212 ;     MS780-E  this   data  is
;4213 ;     blasted in  the last ROM
;4214 ;     location)
```

```
;4215 ;
;4216 ; The following conditions  will result in an error
;4217 ; call:
;4218 ;
;4219 ; - No  memory controller  has been  found with its
;4220 ;   ROMs enabled.
;4221 ;
;4222 ; - Both MS780-C and  MS780-E memories found on the
;4223 ;   SBI, and the MS780-C has its ROMs enabled.
;4224 ;   (Note: If there  are both  type of  memories on
;4225 ;   SBI, i.e. MS780-C and MS780-E, ONLY the MS780-E
;4226 ;   should have its ROMs enabled.
;4227 ;
;4228 ; - Data  in the  first location does not match the
;4229 ;   expected value.
;4230 ;
;4231 ; - The OR result of  the  two locations  does  not
;4232 ;   equal xFFFFFFFF (see above).
;4233 ;
;4234 ; - The  location  that  should  read  zero returns
;4235 ;   other data than expected.
;4236 ;
;4237 ; - The added checksum does not equal the expected.
;4238 ;
;4239 ; - More than one memory controller  found with its
;4240 ;   ROMs enabled.

;1810 ;
;1811 ; MODULE NAME: ESKAR54
;1812 ;
;1813 ; CREATION DATE:  SEPTEMBER 1982
;1814 ; AUTHOR:  DAN GRIGORE
;1815 ;
;1816 ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1817 ;
;1818 ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1819 ;
;1820 ; -  WHAT CHANGE WAS MADE
;1821 ;
;1822 ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1823 ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1824 ;
;1825 ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1826 ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1827 ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1828 ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1829 ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1830 ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1831 ;    ESKAR3C.

;1841  .PAGE
;1842
;1843  .TOC  " Micro Trap Handler and LSI-11 Support Routines"
;1844  .TOC  "    Micro Trap Handler
;1845 ;++
;1846 ; FUNCTIONAL DESCRIPTION:
;1847 ;
;1848 ; This routine is responsible for 'catching' micro-traps
;1849 ; and reporting unexpected traps to the Monitor. Register R[0F]
;1850 ; contains the Trap-Expected Mask. If the specified bit is set in
;1851 ; the mask, the bit is cleared and a RETURN0 is made otherwise,
;1852 ; an error call is made.
;1853 ;
;1854 ; INPUT PARAMETERS:
;1855 ;
;1856 ; R[0F] - Expected Trap Mask
;1857 ;  Trap Code Function
;1858 ;  --------      --------
;1859 ;       0  System Init

            ;1927 ; FUNCTIONAL DESCRIPTION:
            ;1928 ;
            ;1929 ; This routine Initializes the following registers:
            ;1930 ;  PSL   to 1F
            ;1931 ;  CES   to 0
            ;1932 ;  ACC.CS   to disable accellerator
            ;1933 ;  SIR   to 0
            ;1934 ;  CLK.CS   to stop interval timer
            ;1935 ;  TBER0   to disable the TB
            ;1936 ;  SBI.MAINT to    0
            ;1937 ;  SBI.ERR   to 0
            ;1938 ;  FAULT   to 0
            ;1939 ;  COMP   to 0
            ;1940 ;  RC[0E]   to  0
            ;1941 ;  R[0F]   to 0
            ;1942 ; It also performs an SBI UNJAM and disables the CACHE.
            ;1943 ; A SCOPE call is then made to the Monitor.

;2211   .PAGE
;2212   .TOC     START TEST
;2213 ;*********************************************************
;2214 ;**
;2215 ;
;2216 ; Functional Description:
;2217 ; ----------------------
;2218 ;
;2219 ;         This subroutine will be called by all tests that  check  the
;2220 ;    controllers,  or  those  tests  that  have  to switch between the
;2221 ;    controllers when executing.  Its  main  functions  are:  select
;2222 ;    both  controllers  on the MS780-E/H SBI Interface and execute the
;2223 ;    test that called it, call out an error  if  neither  one  of  the
;2224 ;    controllers can be configured properly, if all the controllers on
;2225 ;    a MS780-E/H were configured and tested, it should select the next
;2226 ;    MS780-E/H on the SBI and repeat the above sequence.
;2227 ;    A test making use of this  subroutine  should  be  configured  as
;2228 ;    follows:
;2229 ;
;2230 ;
;2231 ;       Begin TEST.XX
;2232 ;        :
;2233 ;        :   Call NEWTST
;2234 ;        :   Call FIND.MS780E
;2235 ;        :   IF No MS780-E's on the SBI
;2236 ;        :     THEN
;2237 ;        :         Skip to End of TEST.XX
;2238 ;        :     ELSE
;2239 ;        :
;2240 ;        : RESTART.TEST.XX:
;2241 ;        :
;2242 ;        :   Call START TEST
;2243 ;        :   IF Return1 from START.TEST
;2244 ;        :     THEN
;2245 ;        :         Skip to End of TEST.XX
;2246 ;        :     ELSE.
;2247 ;        :
;2248 ;        ~
;2249 ;
;2250 ;        :
;2251 ;        :   Body of TEST.XX
;2252 ;        :
;2253 ;        ~
;2254 ;
;2255 ;        :   Jump RESTART.TEST.XX
;2256 ;        :
;2257 ;       End TEST.XX
;2258 ;
;2259 ;
;2260 ;         This subroutine makes use of a pointer  in  ID  Register  39
;2261 ;    (Temporary  Register  9)  to  remember   at  which point control
;2262 ;    should be passed when the subroutine is called a second, third or
;2263 ;    fourth  time, depending on the number of MS780-E's on the SBI and
;2264 ;    the numbers of controllers on each.  (Note:  Temporary Register 9
;2265 ;    will  be  cleared  by  the  NEWTST subroutine.) The pointer in ID
```

```
;2266 ;    Register 39 can be interpreted as follows:
;2267 ;
;2268 ;     b00   -   Value that ID Reg 39 should hold when the subroutine is
;2269 ;               called the first time.  When this code is encountered
;2270 ;               this subroutine will try to select the lower controller.
;2271 ;               If the lower controller is misconfigured, the pointer in
;2272 ;               ID Reg 39  is changed to b01 (See below) and the subroutine
;2273 ;               is re-entered.
;2274 ;               If, however there is no misconfiguration, the value in
;2275 ;               ID Reg 39 is changed to b10 and a Return2 is made to the
;2276 ;               calling test.
;2277 ;
;2278 ;     b01   -   This value signifies that an attempt at configuring the
;2279 ;               lower controller failed, and the subroutine will attempt
;2280 ;               to select the upper controller.
;2281 ;               If the upper controller is also misconfigured execution
;2282 ;               stops with a call to ERROR1.
;2283 ;               If there is no misconfiguration on this controller, then
;2284 ;               the code in ID Reg 39 is changed to b11 and a Return2 is
;2285 ;               made to the calling test.
;2286 ;
;2287 ;     b10   -   This value signifies that the lower controller was selected
;2288 ;               previously and the test was executed once.  If the
;2289 ;               subroutine is entered with this code in ID Reg 39, ID Reg
;2290 ;               39 is loaded with b11 and an attempt is made to select the
;2291 ;               upper controller.
;2292 ;               If there is a misconfiguration on this controller, this
;2293 ;               subroutine is just re-entered.
;2294 ;               Otherwise, a Return2 will be made to the calling test.
;2295 ;
;2296 ;     b11   -   This code identifies the cases in which the test has
;2297 ;               been executed at least once (i.e., at least one of the
;2298 ;               controllers on the MS780-E unit under test could be
;2299 ;               configured properly).  When this code is detected the
;2300 ;               subroutine clears ID Reg 39 and makes a call to
;2301 ;               ENABLE.NEXT.MS780E.  If all MS780-E units have been
;2302 ;               tested then the subroutine executes a Return1.
;2303 ;               Otherwise the subroutine is re-entered.
;2304 ;
;2305 ;

            ;2747  .TOC "    Find MS780-E Memory"
            ;2748 ;++
            ;2749 ; FUNCTIONAL DESCRIPTION:
            ;2750 ;
            ;2751 ;          The diagnostic is designed to handle up to 4 (four)
            ;2752 ;     MS780-E/H's on the 780 SBI. This routine looks at all TR levels
            ;2753 ;     for a MS780-E memory unit.  Upon return, ID registers 3A through
            ;2754 ;     3D will hold the I/O base address of the MS780-E subsystems found
            ;2755 ;     on the SBI, and ID Register 3E will hold the Total number of
            ;2756 ;     MS780-E/H's found minus one. Also, it is to be noted that the
            ;2757 ;     first MS780-E found will have its starting address set to 0
            ;2758 ;     (zero).
            ;2759 ;     All the other MS780-E/H's found will have their starting address
            ;2760 ;     set to all ones. Subroutine ENABLE.NEXT.MS780E will look at ID
            ;2761 ;     Reg 3E to decide if there are any more MS780-E and will take
            ;2762 ;     apropriate action.  Register RC[0E] is used as a pointer to the
            ;2763 ;     current MS780-E unit under test.
            ;2764 ;     If any of: MS780-A, MS780-C or MA780 is found, its address is
            ;2765 ;     set to maximum.

            ;2994  .TOC "   ENABLE NEXT MS780-E"
            ;2995 ;++
            ;2996 ; FUNCTIONAL DESCRIPTION:
            ;2997 ;
            ;2998 ;          This diagnostic will  be able to handle up  to  four  MS780-E units.
            ;2999 ;    They will be tested  separately, according to the TR level at which
            ;3000 ;    they are located,  starting with the one  at the lowest level first.
            ;3001 ;          When  a test has finished  with the first unit, it will have to call
            ;3002 ;    this specific  routine  to see  if any other MS780-E unit is present
            ;3003 ;    on the SBI. If more units are  present, the first one  will be  dis-
            ;3004 ;    abled  by  setting  its  starting  address to maximum, the next unit
            ;3005 ;    will be  enabled  by  setting its starting address to 0 and the test
            ;3006 ;    will be restarted. Subroutine  FIND.MS780E  will  look  on  the  SBI
            ;3007 ;    for  MS780-E/H  subsystems, and will leave their I/O base address in
            ;3008 ;    ID registers 3A through 3D and  a count of the Total number of units
            ;3009 ;    found - 1 in register 3E. In this subroutine the SC register is used
            ;3010 ;    as  a  pointer  to  ID  registers 3A through 3D.

;3181 ;**
;3182 ;
;3183 ; Functional Description:
;3184 ; ----------------------
;3185 ;
;3186 ;      Before the UBA can be accessed by any of the above
;3187 ; subroutines, it should be initialized. The following subroutine
;3188 ; will perform this task by setting bit 1 in the UBA Control
;3189 ; Register.  Since the subroutine will be accessing one of the UBA
;3190 ; registers, as for the previous subroutines the following
;3191 ; registers should be set up by the FIND.MS780E.AND.UBA subroutine:
;3192 ;
;3193 ;  ID[24] - Address of UBA Configuration Register
;3194 ;
;3195 ;  ID[25] - Address of Map Register 0
;3196 ;
;3197 ;  ID[26] - UBA Address Space (20100000)
;3198 ;
;3199 ;  ID[28] - Address of Data Path Register 1
;3200 ;
;3201 ;
;3202 ; Calling Constraint: =0
;3203 ; ------------------
;3204 ;
;3205 ;
;3206 ; Inputs:
;3207 ; ------
;3208 ;
;3209 ; See above description.
;3210 ;
;3211 ;
;3212 ; Outputs:
;3213 ; -------
;3214 ;
;3215 ; No explicit outputs. DW780 Initialized.
;3216 ;
;3217 ;
;3218 ; Side Effects:
;3219 ; ------------
;3220 ;
;3221 ; The Contents of the following registers will be lost:
;3222 ;
;3223 ; D, Q, VA
;3224 ;

```
;3292  .PAGE
;3293  .TOC "   DW780 EXTNDED MASKED WRITE"
;3294 ;*************************************************************
;3295 ;++
;3296 ;
;3297 ; Functional Description:
;3298 ; ----------------------
;3299 ;
;3300 ;      This subroutine is mainly used to 'force' the memory to
;3301 ; perform an Extended Masked Write operation.  A DW780 will have to
;3302 ; be used for this operation since the 11/780 CPU does not have the
;3303 ; ability to execute such a function.  Before this subroutine is
;3304 ; entered it is assumed that:  the calling routine has configured
;3305 ; the memory controllers as desired, Register D contains the byte
;3306 ; offset and that the following data has been set up in ID
;3307 ; registers by the FIND.MS780E.AND.UBA routine:
;3308 ;
;3309 ;
;3310 ;  ID[24] - Address of UBA Configuration Register
;3311 ;
;3312 ;  ID[25] - Address of Map Register 0
;3313 ;
;3314 ;  ID[26] - UBA Address Space (20100000)
;3315 ;
;3316 ;  ID[28] - Address of Data Path Register 1
;3317 ;
;3318 ;      The subroutine will set up Map Register 0 with the page
;3319 ; address of the memory (Note:  The UBA will be programed so that
;3320 ; write operations will be done only to location 0 of the memory.
;3321 ; This entails that the starting address of the memory should be
;3322 ; set to 0 before this subroutine is entered, and that a memory
;3323 ; array board should always be present in slot 0.  These
;3324 ; restrictions are imposed in order to keep the tests simple.).
;3325 ; A write will be done to one of the eight bytes of a quad-word in
;3326 ; the UBA Address space followed by a purge of the Buffered Data
;3327 ; Path.  The purge will actually force the UBA to execute the
;3328 ; Extended Masked Write.
;3329 ;
;3330 ;      Due to the way in which the UBA works, Extended Masked
;3331 ; Writes will not always be executed.  When addressing a byte in
;3332 ; the lower longword of a quad-word location in the UBA address
;3333 ; space and then purging the UBA, a Longword Masked Write will take
;3334 ; place.  Extended Masked Writes will only take place when
;3335 ; addressing a byte in the upper longword of a quad-word location
;3336 ; in the UBA Address space.
;3337 ;
;3338 ;
;3339 ; Calling Constraint: =0
;3340 ; ------------------
;3341 ;

;3396  .PAGE
;3397  .TOC "   DW780 LONGWORD READ ROUTINE
;3398 ;*************************************************************
;3399 ;**
;3400 ;
;3401 ; Functional Description:
;3402 ; ---------------------
;3403 ;
;3404 ;
;3405 ;      This subroutine is used to force the  memory  to  execute  a
;3406 ; Longword  Read  Masked.    A  UBA is necessary for this operation
;3407 ; since the CPU can only execute Extended  Reads.   As  before  the
;3408 ; following  registers  should be set up by the FIND.MS780E.AND.UBA
;3409 ; routine:
;3410 ;
;3411 ;  ID[24] - Address of UBA Configuration Register
;3412 ;
;3413 ;  ID[25] - Address of Map Register 0
;3414 ;
;3415 ;  ID[26] - UBA Address Space (20100000)
;3416 ;
;3417 ;  ID[28] - Address of Data Path Register 1
;3418 ;
;3419 ;      When the subroutine is entered, Register D should hold a two
;3420 ; bit code for the type of operation to be performed.  These codes,
;3421 ; aside from designating the type of operation, will be used  as  a
;3422 ; Byte  Offset when the Longword Read will take place.  They are as
;3423 ; follows:
;3424 ;
;3425 ;  b00 - Read Word 0
;3426 ;
;3427 ;  b01 - Read Byte 1
;3428 ;
;3429 ;  b10 - Read Word 1
;3430 ;
;3431 ;  b11 - Read Byte 3
;3432 ;
;3433 ; The subroutine will set up Map Register 0 with the  Page  Address
;3434 ; of  the  memory  (See note for DW780.EXTND.WRITE.MSKD subroutine.
;3435 ; Same  restrictions  are  valid  here.).   Upon  decoding  of  the
;3436 ; information in Register D, appropriate action will be taken.
;3437 ;
;3438 ;
;3439 ; Calling Constraint: =0
;3440 ; --------- --------
;3441 ;
;3442 ;
;3443 ; Inputs:
;3444 ; ------
;3445 ;
;3446 ; ID Registers 24,25,26,28 must be set up as detailed above.
;3447 ;
;3448 ; D Reg MUST hold the Byte Offset as described above
;3449 ;
;3450 ; Outputs:
```

```
            ;3451 ; -------
            ;3452 ;
            ;3453 ; Data Read from the memory will be returned in the D register
            ;3454 ;
            ;3455 ;
            ;3456 ; Side Effects:
            ;3457 ; ------------
            ;3458 ;
            ;3459 ; The contents of the following registers will be lost:
            ;3460 ;
            ;3461 ; RC[6], D, Q, SC, VA
            ;3462 ;
            ;3463 ;--
            ;3464 ;*****************************************************************

;3490  .PAGE 'TEST 1FF EXTENDED MASK WRITES'
;3491 ;*************************************************************
;3492 ;+++
;3493 ;
;3494 ; Functional Description:
;3495 ; ----------------------
;3496 ;
;3497 ; This test programs the DW780 to perfrom Extended Masked Writes to
;3498 ; memory location 0.  Each byte within the quadword will be accessed in
;3499 ; a loop.  The test starts by initializing quadword locaton 0 to all
;3500 ; ones.  Next, a byte of all zeroes is written to the DW780 Buffered
;3501 ; Data path.  Purging the DW780 will cause it to perfrom an Extended
;3502 ; Masked Write.  Location 0 is then read to verify the integrity of the
;3503 ; data.

```
;3731   .PAGE 'TEST 200 CRD/RDS ERRORS ON EXTENDED MASKED WRITE
;3732 ;*************************************************************
;3733 ;+++
;3734 ;
;3735 ; Functional Description:
;3736 ; ----------------------
;3737 ;
;3738 ; As in the previous test the DW780 is used to perfrom Extended Masked
;3739 ; Writes to Memory.  However, in this case CRD and RDS errors are
;3740 ; forced using Diagnostic Mode 2.
;3741 ;
;3742 ;   [Subtest 1:]
;3743 ;
;3744 ; This subtest initializes locations 0 and 4 on the array, and sets the
;3745 ; check bits in CNFG B register, so that a CRD error will be forced in
;3746 ; bit 0 when executing an Extended Masked Write.  Following the write
;3747 ; operation, a read will retreive the data for checking.  It is expected
;3748 ; that both the lower and the upper longowrds will have the error
;3749 ; corrected.
;3750 ;
;3751 ;   [Subtest 2:]
;3752 ;
;3753 ; This subtest initializes locations 0 and 4 on the array and sets the
;3754 ; check bits in CNFG B register so that a RDS error occurs when the DW780
;3755 ; performs an Extended Masked Write.  After the Write operation takes
;3756 ; place, the data on the array is checked and it is expected that it will
;3757 ; not be modified (ie., write cycle was aborted.)
;3758 ;
;3759 ;
;3760 ; Logic Description:
;3761 ; ------------------
;3762 ;

;4013  .PAGE 'TEST 201 LONGWORD READ
;4014 ;*************************************************************
;4015 ;+++
;4016 ;
;4017 ; Functional Description:
;4018 ; ----------------------
;4019 ;
;4020 ; This sequence of tests makes use of the DW780 to perfrom longword reads
;4021 ; from memory.  Both subtests verify that the data returned is correct by
;4022 ; checking it against the data used to initialize the memory.
;4023 ;
;4024 ;   [Subtest 1:]
;4025 ;
;4026 ; This subtest initializes location 0 of the array to all ones and then
;4027 ; programs the DW780 to execute a longword read.
;4028 ;
;4029 ;   [Subtest 2:]
;4030 ;
;4031 ; Location 0 of the array is initialized to all ones.  The DW780 is then
;4032 ; programmed to execute a  Masked Read .
;4033 ;
;4034 ;
;4035 ; Logic Description:
;4036 ; -----------------
;4037 ;   N/A

;4256  .PAGE "TEST 202 CRD/RDS ERRORS ON LONGWORD READS"
;4257 ;*************************************************************
;4258 ;+++
;4259 ;
;4260 ; Functional Description:
;4261 ; ----------------------
;4262 ;
;4263 ; The following tests make use of the DW780 to perfrom longword reads of
;4264 ; the memory array while forcing CRD/RDS errors.
;4265 ;
;4266 ;   [Subtest 1:]
;4267 ;
;4268 ; This subtest initializes locations 0 and 4 of the array to all zeroes.
;4269 ; By making use of diagnostic mode 2 bits <6:0> of CNFG B register are
;4270 ; set up so that a CRD error will be forced when a read operation takes
;4271 ; place.  The test passes if:  CRD bit set in the status register of the
;4272 ; DW780, CRD bit set in CNFG C/D register, the data returned was
;4273 ; corrected on the array and location 4 on the array remains unchanged
;4274 ; following the read.
;4275 ;
;4276 ;   [Subtest 2:]
;4277 ;
;4278 ; This subtest initializes locations 0 and 4 of the memory array to all
;4279 ; zeroes.  Using diagnostic mode 2 to force a RDS error when a read of
;4280 ; the array is attempted.  The test is successfull only if:  The RDS bit
;4281 ; is set in the status register of the DW780, RDS bit set in CNFG C/D
;4282 ; register and neither of locations 0 or 4 was mod   d in any way.
;4283 ;

;1810 ;
;1811 ; MODULE NAME: ESKAR55
;1812 ;
;1813 ; CREATION DATE:  SEPTEMBER 1982
;1814 ; AUTHOR:  DAN GRIGORE
;1815 ;
;1816 ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1817 ;
;1818 ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1819 ;
;1820 ; -  WHAT CHANGE WAS MADE
;1821 ;
;1822 ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1823 ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1824 ;
;1825 ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1826 ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1827 ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1828 ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1829 ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1830 ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1831 ;    ESKAR3C.

```

```
            ;1841  .PAGE
            ;1842  .TOC  MICRO TRAP HANDLER
            ;1843 ;+
            ;1844 ; FOLLOWING ARE THE MICRO TRAP VECTOR ASSIGNMENTS. EACH VECTOR LOADS THE SC
            ;1845 ; WITH A NUMBER, AND LOADS THE Q REGISTER WITH THE CONTENTS OF R[0F].
            ;1846 ; R[0F] IS SETUP BY THE PROGRAM TO INDICATE WHETHER A MICRO TRAP IS EXPECTED
            ;1847 ; THIS IS DONE BY SETTING THE BIT IN R[0F] THAT CORRESPONDS TO THE NUMBER
            ;1848 ; THAT IS LOADED INTO THE SC BY THAT PARTICULAR MICRO TRAP.
            ;1849 ;
            ;1850 ; FOR EXAMPLE: IF A TEST EXPECTED A TB MISS  MICRO TRAP IT WOULD SET BIT
            ;1851 ; 6 IN SCRATCH PAD R[0F]. WHEN THE TRAP OCCURRED, THE TRAP CATCHER
            ;1852 ; ROUTINE WOULD SENSE THAT THE TRAP WAS EXPECTED AND CLEAR BIT 6 IN
            ;1853 ; R[0F] AND DO A RETURN0.
            ;1854 ;
            ;1855 ; IF THE BIT FOR THE PARTICULAR TRAP IS NOT SET IN R[0F], THE TRAP ROUTINE
            ;1856 ; READS THE ERROR REGISTERS, SAVES THEM FOR TYPEOUT, AND MAKES AN ERROR CALL
            ;1857 ; TO THE CONSOLE.
            ;1858 ;
            ;1859 ; THE JUMP FIELDS OF ALL THE TRAP VECTORS EXCEPT THE CONTROL STORE PARITY
            ;1860 ; ERROR VECTOR, POINT TO A ROUTINE THAT EXECUTES A RETURN0 IF THE TRAP WAS
            ;1861 ; EXPECTED. THE CS PARITY ERROR VECTOR POINTS TO A ROUTINE THAT EXECUTES A
            ;1862 ; RETURN1 IF THE TRAP WAS EXPECTED SINCE THE ADDRESS THAT WAS PUSHED ON THE
            ;1863 ; STACK IS THE ADDRESS OF THE MICRO WORD WITH BAD PARITY.
            ;1864 ;-

            ;1935 ;++
            ;1936 ; FUNCTIONAL DESCRIPTION:
            ;1937 ;
            ;1938 ; This routine Initializes the following registers:
            ;1939 ;  PSL    to 1F
            ;1940 ;  CES    to 0
            ;1941 ;  ACC.CS   to disable accellerator
            ;1942 ;  SIR    to 0
            ;1943 ;  CLK.CS   to stop interval timer
            ;1944 ;  TBER0   to disable the TB
            ;1945 ;  SBI.MAINT to    0
            ;1946 ;  SBI.ERR   to 0
            ;1947 ;  FAULT   to 0
            ;1948 ;  COMP    to 0
            ;1949 ;  RC[0E]   to  0
            ;1950 ;  R[0F]   to 0
            ;1951 ; It also performs an SBI UNJAM and disables the CACHE.
            ;1952 ; A SCOPE call is then made to the Monitor.

            ;2458  .PAGE
            ;2459  .TOC "   Find MS780-E Memory
            ;2460 ;++
            ;2461 ; FUNCTIONAL DESCRIPTION:
            ;2462 ;
            ;2463 ;          The diagnostic is designed to handle up to 4 (four)
            ;2464 ;     MS780-E/H's on the 780 SBI.  This routine looks at all TR levels
            ;2465 ;     for a MS780-E memory unit.  Upon return, ID registers 3A through
            ;2466 ;     3D will hold the I/O base address of the MS780-E subsystems found
            ;2467 ;     on the SBI, and ID Register 3E will hold the Total number of
            ;2468 ;     MS780-E/H's found minus one.  Also, it is to be noted that the
            ;2469 ;     first MS780-E found will have its starting address set to 0
            ;2470 ;     (zero).
            ;2471 ;     All the other MS780-E/H's found will have their starting address
            ;2472 ;     set to all ones.  Subroutine ENABLE.NEXT.MS780E will look at ID
            ;2473 ;     Reg 3E to decide if there are any more MS780-E and will take
            ;2474 ;     apropriate action.  Register RC[0E] is used as a pointer to the
            ;2475 ;     current MS780-E unit under test.
            ;2476 ;     If any of:  MS780-A, MS780-C or MA780 is found, its address is
            ;2477 ;     set to maximum.
            ;2478 ;

            ;2665  .TOC "    ENABLE NEXT MS780-E
            ;2666 ;**
            ;2667 ; FUNCTIONAL DESCRIPTION:
            ;2668 ;
            ;2669 ;          This diagnostic will  be able to handle up  to  four  MS780-E units.
            ;2670 ;    They will be tested  separately, according to the TR level at which
            ;2671 ;    they are located,  starting with the one  at the lowest level first.
            ;2672 ;          When  a test has finished  with the first unit, it will have to call
            ;2673 ;    this specific  routine  to see  if any other MS780-E unit is present
            ;2674 ;    on the SBI. If more units are  present, the first one  will be  dis-
            ;2675 ;    abled  by  setting  its  starting  address to maximum, the next unit
            ;2676 ;    will be  enabled  by  setting its starting address to 0 and the test
            ;2677 ;    will be restarted. Subroutine  FIND.MS780E  will  look  on  the  SBI
            ;2678 ;    for  MS780-E/H  subsystems, and will leave their I/O base address in
            ;2679 ;    ID registers 3A through 3D and  a count of the Total number of units
            ;2680 ;    found - 1 in register 3E. In this subroutine the SC register is used
            ;2681 ;    as  a  pointer  to  ID  registers 3A through 3D.

;3163 .PAGE  TEST 207 CPU READ AND SBI INVALIDATE SIMULTANEOUSLY
;3164 ;*****************************************************************
;3165 ;*
;3166 ;
;3167 ; CPU READ AND SBI INVALIDATE SIMULTANEOUSLY
;3168 ;
;3169 ; TEST DESCRIPTION
;3170 ;
;3171 ; THIS TEST CHECKS THE SBI INVALIDATE FUNCTION USING THE UNIBUS
;3172 ; ADAPTER TO GENERATE THE WRITE TO MEMORY. THE TEST IS STRUCTURED
;3173 ; TO CHECK THE CASE WHERE THE CPU IS WAITING FOR READ DATA AND THE
;3174 ; UBA ISSUES A WRITE COMMAND TO THE MEMORY. WHEN THE CPU RECEIVES
;3175 ; THE READ DATA, IT SHOULD BE MARKED INVALID IN THE CACHE IF THE
;3176 ; UBA REFERANCED THE SAME (ALMOST) LOCATION IS THE CPU.
;3177 ; DIFFERANT ADDRESS PATTERNS ARE USED TO CHECK THE ADDRESS COMPARATOR
;3178 ; ON THE SBL MODULE.
;3179 ;
;3180 ; SUBTEST 1 - CHECK THE MARK INVALID COMPARATOR WITH ALL ZERO'S AND
;3181 ;      ALL ONE'S. SHOULD INVALIDATE THE READ DATA.
;3182 ;
;3183 ; SUBTEST 2 - SET THE A LEG AT ALL ZERO'S AND FLOAT A ONE ACROSS THE
;3184 ;      B LEG OF THE MARK INVALID COMPARATOR.
;3185 ;
;3186 ; SUBTEST 3 - SET THE B LEG AT ALL ZERO'S AND FLOAT A ONE ACROSS THE
;3187 ;      A LEG OF THE MARK INVALID COMPARATOR.
;3188 ;
;3189 ; SUBTEST 4 - SET THE A LEG TO ALL ONE'S AND FLOAT A ZERO ACROSS THE
;3190 ;      B LEG OF THE MARK INVALID COMPARATOR.
;3191 ;
;3192 ; SUBTEST 5 - SET THE B LEG TO ALL ONE'S AND FLOAT A ZERO ACROSS THE
;3193 ;      A LEG OF THE MARK INVALID COMPARATOR.
;3194 ;
;3195 ; LOGIC DESCRIPTION
;3196 ;
;3197 ; THIS TEST CHECKS THE ADDRESS COMPARATOR AND THE  MARK INVALID
;3198 ; LATCH ON THE SBL MODULE.
;3199 ;
;3200 ; ERROR DESCRIPTION
;3201 ;
;3202 ; DATA: EXPECTED HIT AND MISS BITS
;3203 ;       RECEIVED HIT AND MISS BITS
;3204 ;       ADDRESS REFERANCED BY UBA (A LEG OF COMPARATOR)
;3205 ;       ADDRESS REFERANCE BY CPU (B LEG OF COMPARATOR)
;3206 ;
;3207 ; NOTE: THE UBA ADDRESS IS ADJUSTED TO THE SAME BIT POSITIONS AS
;3208 ;  THE CPU ADDRESS.

;3571 .PAGE  TEST 208 SBI REQUESTS 4, 5, 6, OR 7
;3572 ;*****************************************************************
;3573 ;**
;3574 ;
;3575 ; SBI REQUESTS 4, 5, 6, OR 7
;3576 ;
;3577 ; TEST DESCRIPTION
;3578 ;
;3579 ; THIS TEST CHECKS THE SBI INTERRUPTS AT LEVELS 4, 5, 6, OR 7
;3580 ; DEPENDING ON THE ASSIGNED LEVELS OF THE DEVICES AVAILABLE.
;3581 ;
;3582 ; THE FIRST PART OF THE TEST SEARCHES THE SBI FOR DEVICES. IF A DEVICE
;3583 ; IS FOUND, THE DEVICE CODE IS CHECKED TO DETERMINE WETHER IT'S A
;3584 ; UBA OR MBA. WHEN THIS DETERMINATION IS MADE, EXECUTION GOES TO
;3585 ; THE APPROPRIATE ROUTINE TO CAUSE THAT DEVICE TO INTERRUPT. ONCE THE
;3586 ; INTERRUPT IS ACTIVE, THE CPU INTERRUPT LOGIC IS TESTED INDEPENDENT
;3587 ; OF THE DEVICE TYPE.
;3588 ;
;3589 ; THE UBA ROUTINE SETS AND CLEARS THE UNIBUS POWER DOWN BIT IN
;3590 ; CONTROL REGISTER 1 WITH THE INTERRUPT ENABLE BIT SET. THIS SHOULD
;3591 ; CAUSE A UBA INTERRUPT. THE ROUTINE THEN READS THE UBA VECTOR REGISTERS
;3592 ; TO DETERMINE WHAT LEVEL THE INTERRUPT IS ACTIVE ON. THIS LEVEL IS
;3593 ; THEN CHECKED AGAINST THE IPL ACTIVE LEVEL IN THE CPU.
;3594 ;
;3595 ; THE MBA ROUTINE SETS THE MAINTENANCE MODE AND INTERRUPT ENABLE BITS
;3596 ; IN MBA REGISTER 1 AND THEN SETS AND CLEARS THE 'SIMULATE ATTENTION
;3597 ; BIT IN REGISTER 4. THIS SHOULD CAUSE AN INTERRUPT. THE ROUTINE
;3598 ; THEN READS THE IPL ACTIVE LEVEL AND ASSUMES THAT THIS IS THE
;3599 ; CORRECT INTERRUPT LEVEL FOR THIS DEVICE. IT IS CHECKED TO ENSURE
;3600 ; THAT IT IS BETWEEN 14 AND 17.
;3601 ;
;3602 ; SUBTEST 1 - UBA--CHECK IPL ACTIVE
;3603 ;      MBA--DO NOTHING
;3604 ;
;3605 ; SUBTEST 2   CHECK THE INTERRUPT VECTOR FOR THE ACTIVE INTERRUPT LEVEL
;3606 ;
;3607 ; SUBTEST 3 - CHECK THE INTERRUPT VECTOR WHILE FLOATING A ONE ACROSS
;3608 ;      THE  PRIORITY  BITS (OF THE VECTOR REGISTER)
;3609 ;
;3610 ; SUBTEST 4 - CHECK THE INTERRUPT REQUEST BRANCH
;3611 ;
;3612 ; SUBTEST 5 - CHECK THE IB SERVICE BITS WITH THE INTERRUPT ACTIVE.
;3613 ;
;3614 ; SUBTEST 6 - ASSERT A RECEIVER INTERRUPT AND CHECK THE INTERRUPT REQUEST BRANCH
;3615 ;
;3616 ; LOGIC DESCRIPTION
;3617 ;
;3618 ; THIS TEST CHECKS MORE OF THE VECTOR ROM, THE  EXT INTR REQ , AND
;3619 ; THE VECTOR BITS ON THE ICL MODULE.
;3620 ;
;3621 ; ERROR DESCRIPTION
;3622 ;
;3623 ; SUBTEST 1   DATA: EXPECTED IPL ACTIVE LEVEL
;3624 ;     RECEIVED IPL ACTIVE LEVEL
;3625 ;     NOT USED
```

;1809 ;
;1810 ;
;1811 ; MODULE NAME: ESKAR56
;1812 ;
;1813 ; CREATION DATE:  SEPTEMBER 1982
;1814 ; AUTHOR:  DAN GRIGORE
;1815 ;
;1816 ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1817 ;
;1818 ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1819 ;
;1820 ; -  WHAT CHANGE WAS MADE
;1821 ;
;1822 ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1823 ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1824 ;
;1825 ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1826 ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1827 ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1828 ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1829 ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1830 ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1831 ;    ESKAR3C.
;1832 ;

```

```
            ;1841   .PAGE
            ;1842   .TOC  MICROTRAP HANLDE AND LSI ROUTINES
            ;1843 ;*
            ;1844 ; FOLLOWING ARE THE MICRO TRAP VECTOR ASSIGNMENTS. EACH VECTOR LOADS THE SC
            ;1845 ; WITH A NUMBER, AND LOADS THE Q REGISTER WITH THE CONTENTS OF R[0F].
            ;1846 ; R[0F] IS SETUP BY THE PROGRAM TO INDICATE WHETHER A MICRO TRAP IS EXPECTED
            ;1847 ; THIS IS DONE BY SETTING THE BIT IN R[0F] THAT CORRESPONDS TO THE NUMBER
            ;1848 ; THAT IS LOADED INTO THE SC BY THAT PARTICULAR MICRO TRAP.
            ;1849 ;
            ;1850 ; FOR EXAMPLE: IF A TEST EXPECTED A  TB MISS  MICRO TRAP IT WOULD SET BIT
            ;1851 ; 6 IN SCRATCH PAD R[0F]. WHEN THE TRAP OCCURRED, THE TRAP CATCHER
            ;1852 ; ROUTINE WOULD SENSE THAT THE TRAP WAS EXPECTED AND CLEAR BIT 6 IN
            ;1853 ; R[0F] AND DO A RETURN0.
            ;1854 ;
            ;1855 ; IF THE BIT FOR THE PARTICULAR TRAP IS NOT SET IN R[0F], THE TRAP ROUTINE
            ;1856 ; READS THE ERROR REGISTERS, SAVES THEM FOR TYPEOUT, AND MAKES AN ERROR CALL
            ;1857 ; TO THE CONSOLE.
            ;1858 ;
            ;1859 ; THE JUMP FIELDS OF ALL THE TRAP VECTORS EXCEPT THE CONTROL STORE PARITY
            ;1860 ; ERROR VECTOR, POINT TO A ROUTINE THAT EXECUTES A RETURN0 IF THE TRAP WAS
            ;1861 ; EXPECTED. THE CS PARITY ERROR VECTOR POINTS TO A ROUTINE THAT EXECUTES A
            ;1862 ; RETURN1 IF THE TRAP WAS EXPECTED SINCE THE ADDRESS THAT WAS PUSHED ON THE
            ;1863 ; STACK IS THE ADDRESS OF THE MICRO WORD WITH BAD PARITY.

                ;1934 ;++
                ;1935 ; FUNCTIONAL DESCRIPTION:
                ;1936 ;
                ;1937 ; This routine Initializes the following registers:
                ;1938 ;  PSL   to 1F
                ;1939 ;  CES   to 0
                ;1940 ;  ACC.CS   to disable accellerator
                ;1941 ;  SIR   to 0
                ;1942 ;  CLK.CS   to stop interval timer
                ;1943 ;  TBER0   to disable the TB
                ;1944 ;  SBI.MAINT to    0
                ;1945 ;  SBI.ERR   to 0
                ;1946 ;  FAULT   to 0
                ;1947 ;  COMP   to 0
                ;1948 ;  RC[0E]   to  0
                ;1949 ;  R[0F]   to 0
                ;1950 ; It also performs an SBI UNJAM and disables the CACHE.
                ;1951 ; A SCOPE call is then made to the Monitor.
                ;1952 ;

            ;2458  .PAGE
            ;2459  .TOC "    Find MS780-E Memory
            ;2460 ;**
            ;2461 ; FUNCTIONAL DESCRIPTION:
            ;2462 ;
            ;2463 ;          The diagnostic is designed to handle up to 4 (four)
            ;2464 ;     MS780-E/H's on the 780 SBI.  This routine looks at all TR levels
            ;2465 ;     for a MS780-E memory unit.  Upon return, ID registers 3A through
            ;2466 ;     3D will hold the I/O base address of the MS780-E subsystems found
            ;2467 ;     on the SBI, and ID Register 3E will hold the Total number of
            ;2468 ;     MS780-E/H's found minus one.  Also, it is to be noted that the
            ;2469 ;     first MS780-E found will have its starting address set to 0
            ;2470 ;     (zero).
            ;2471 ;     All the other MS780-E/H's found will have their starting address
            ;2472 ;     set to all ones.  Subroutine ENABLE.NEXT.MS780E will look at ID
            ;2473 ;     Reg 3E to decide if there are any more MS780-E and will take
            ;2474 ;     apropriate action.  Register RC[0E] is used as a pointer to the
            ;2475 ;     current MS780-E unit under test.
            ;2476 ;     If any of:  MS780-A, MS780-C or MA780 is found, its address is
            ;2477 ;     set to maximum.
            ;2478 ;
            ;2479 ; CALLING CONSTRAINT:
            ;2480 ;
            ;2481 ; =00
            ;2482 ;
            ;2483 ; OUTPUTS:

            ;2666  .PAGE
            ;2667  .TOC     ENABLE NEXT MS780-E
            ;2668 ;++
            ;2669 ; FUNCTIONAL DESCRIPTION:
            ;2670 ;
            ;2671 ;          This diagnostic will  be able to handle up  to  four  MS780-E units.
            ;2672 ;    They will be tested  separately, according to the TR level at which
            ;2673 ;    they are located,  starting with the one  at the lowest level first.
            ;2674 ;          When  a test has finished  with the first unit, it will have to cal
            ;2675 ;    this specific  routine  to see  if any other MS780-E unit is present
            ;2676 ;    on the SBI. If more units are  present, the first one  will be  dis-
            ;2677 ;    abled  by  setting  its  starting  address to maximum, the next unit
            ;2678 ;    will be  enabled  by  setting its starting address to 0 and the test
            ;2679 ;    will be restarted. Subroutine  FIND.MS780E  will  look  on  the  SBI
            ;2680 ;    for  MS780-E/H  subsystems, and will leave their I/O base address in
            ;2681 ;    ID registers 3A through 3D and  a count of the Total number of units
            ;2682 ;    found - 1 in register 3E. In this subroutine the SC register is used
            ;2683 ;    as  a  pointer  to  ID  registers 3A through 3D.

            ;3090 .PAGE 'TEST 20C SBI INVALIDATE ON WRITE-MISS PARITY ERROR IN GR0
            ;3091 ;**********************************************************************
            ;3092 ;**
            ;3093 ;
            ;3094 ; SBI INVALIDATE ON WRITE-MISS PARITY ERROR IN GR0
            ;3095 ;
            ;3096 ; TEST DESCRIPTION
            ;3097 ; THIS CHECKS THAT THE CACHE IS INVALIDATED WHEN A WRITE-MISS
            ;3098 ; PARITY ERROR IN GROUP 0 IS DETECTED. ADDRESS 1004 IS FIRST VALIDATED.
            ;3099 ; THEN THE REVERSE PARITY BITS ARE SET AND ADDRESS 4 IS WRITTEN WITH
            ;3100 ; A DIFFERENT DATA PATTERN THAN ADDRESS 1004 WAS VALIDATED WITH.
            ;3101 ; THE REVERSE PARITY IS THEN DISABLED AND ADDRESS 1004 IS READ TO SEE
            ;3102 ; THAT THE DATA CHANGED. LOCATION 1004 SHOULD STILL BE A HIT IN GROUP 0
            ;3103 ; SINCE THE REVERSE PARITY FUNCTION DISABLES THE WRITE PULSE TO THE
            ;3104 ; ADDRESS MATRIX BUT NOT THE DATA MATRIX.
            ;3105 ;
            ;3106 ;LOGIC DESCRIPTION
            ;3107 ; THE WRITE-MISS PARITY ERROR FF ON SBLR AND ASSOCIATED
            ;3108 ; LOGIC ON M8218 AND M8219 ARE TESTED.
            ;3109 ;
            ;3110 ; ERROR DESCRIPTION
            ;3111 ; DATA: EXPECTED READ DATA

            ;3159 .PAGE  TEST 20D SBI INVALIDATE ON WRITE-MISS PARITY ERROR IN GR1
            ;3160 ;*****************************************************************
            ;3161 ;**
            ;3162 ;
            ;3163 ; SBI INVALIDATE ON WRITE-MISS PARITY ERROR IN GR1
            ;3164 ;
            ;3165 ; TEST DESCRIPTION
            ;3166 ; THIS TEST CHECKS THAT THE CACHE IS INVALIDATED ON A WRITE-MISS
            ;3167 ; PARITY ERROR IN GROUP 1.
            ;3168 ; ADDRESS 1004 IS FIRST VALIDATED. THEN THE REVERSE PARITY
            ;3169 ; BITS ARE SET AND LOCATION 4 IS WRITTEN WITH A DIFFERENT DATA
            ;3170 ; PATTERN THAN ADDRESS 1004 WAS VALIDATED WITH. THE REVERSE PARITY
            ;3171 ; IS THEN DISABLED AND LOCATION 1004 IS READ TO SEE THAT THE
            ;3172 ; DATA CHANGED. LOCATION 1004 SHOULD STILL BE A HIT IN GROUP 1
            ;3173 ; SINCE THE REVERSE PARITY FUNCTION DISABLES THE WRITE PULSE
            ;3174 ; TO THE ADDRESS MATRIX BUT NOT THE DATA MATRIX.
            ;3175 ;
            ;3176 ;LOGIC DESCRIPTION
            ;3177 ; THE WRITE-MISS PARITY ERROR FF ON SBLR AND ASSOCIATED
            ;3178 ; LOGIC ON M8219 AND M8218 ARE TESTED.
            ;3179 ;
            ;3180 ; ERROR DESCRIPTION
            ;3181 ;

            ;3364 .PAGE 'TEST 210 INTERRUPT SUMMARY READ TEST'
            ;3365 ;*****************************************************************
            ;3366 ;**
            ;3367 ;
            ;3368 ; INTERRUPT SUMMARY READ TEST
            ;3369 ;
            ;3370 ;TEST DESCRIPTION
            ;3371 ; THIS TEST CHECKS THAT THE CPU RECEIVES THE CORRECT RESPONSE
            ;3372 ; FROM DEVICES WHEN AN SBI INTERRUPT OCCURS AND THE CPU ISSUES
            ;3373 ; AN INTERRUPT SUMMARY READ COMMAND.
            ;3374 ; THE SBI IS SEARCHED FOR DEVICES. IF A DEVICE IS FOUND, THE
            ;3375 ; DEVICE CODE IS CHECKED TO DETERMINE WHETHER IT IS A UBA OR
            ;3376 ; AN MBA. WHEN THAT DETERMINATION IS MADE, EXECUTION GOES TO
            ;3377 ; THE APPROPRIATE ROUTINE TO CAUSE THAT DEVICE TO INTERRUPT.
            ;3378 ; ONCE THE INTERRUPT IS ACTIVE, THE CPU ISSUES AN INTERRUPT
            ;3379 ; SUMMARY READ COMMAND AND WAITS FOR THE DEVICE TO RESPOND.
            ;3380 ; THE RESPONSE IS CHECKED FOR THE CORRECT BIT PAIR FOR THE
            ;3381 ; CURRENT TR BEING TESTED.
            ;3382 ;
            ;3383 ; THE UBA ROUTINE SETS AND CLEARS THE UNIBUS POWER DOWN BIT
            ;3384 ; IN UBA CONTROL REGISTER 1 WITH THE INTERRUPT ENABLE BIT
            ;3385 ; SET. THIS WILL CAUSE THE UBA TO INTERRUPT.
            ;3386 ;
            ;3387 ; THE MBA ROUTINE SETS THE MAINTENANCE MODE AND INTERRUPT
            ;3388 ; ENABLE BITS IN MBA REGISTER 1 AND THEN SETS AND CLEARS THE
            ;3389 ; SIMULATE ATTENTION BIT IN REGISTER 4. THIS WILL CAUSE AN
            ;3390 ; INTERRUPT.
            ;3391 ;
            ;3392 ;LOGIC DESCRIPTION
            ;3393 ; THE ISR LOGIC ON SBLA AND ASSOCIATED LOGIC ON M8218
            ;3394 ; AND M8219 IS TESTED.
            ;3395 ;
            ;3396 ;ERROR DESCRIPTION

;1808 ;*****************************************************************************
;1809 ;
;1810 ;
;1811 ; MODULE NAME: ESKAR57
;1812 ;
;1813 ; CREATION DATE:  SEPTEMBER 1982
;1814 ; AUTHOR:  DAN GRIGORE
;1815 ;
;1816 ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1817 ;
;1818 ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1819 ;
;1820 ; -  WHAT CHANGE WAS MADE
;1821 ;
;1822 ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1823 ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1824 ;
;1825 ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1826 ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1827 ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1828 ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1829 ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1830 ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1831 ;    ESKAR3C.
;1832 ;
;1833 ; START OF REVISION HISTORY:
;1834 ;
;1835 ; Test 213  Edit # 02-02
;1836 ; Added subroutine "INIT_DW780' and inserted calls to this subroutine
;1837 ; in subtests 3 and 6 to initialize the DW780 before using it to do
;1838 ; a read from memory. Also, in both subtests, changed macro ALU_D.AND.MASK
;1839 ; to ALU_D.ANDNOT.MASK so that the expected satus register bit(bit 9
;1840 ; for subt.3 and bit 8 for subt.6) would get masked in instead of
;1841 ; masked out.
;1842 ;
;1843 ;
;1844 ;
;1845 ;*****************************************************************************

```

```
            ;1847  .PAGE
            ;1848
            ;1849 ;*
            ;1850 ; FOLLOWING ARE THE MICRO TRAP VECTOR ASSIGNMENTS. EACH VECTOR LOADS THE SC
            ;1851 ; WITH A NUMBER, AND LOADS THE Q REGISTER WITH THE CONTENTS OF R[0F].
            ;1852 ; R[0F] IS SETUP BY THE PROGRAM TO INDICATE WHETHER A MICRO TRAP IS EXPECTED
            ;1853 ; THIS IS DONE BY SETTING THE BIT IN R[0F] THAT CORRESPONDS TO THE NUMBER
            ;1854 ; THAT IS LOADED INTO THE SC BY THAT PARTICULAR MICRO TRAP.
            ;1855 ;
            ;1856 ; FOR EXAMPLE: IF A TEST EXPECTED A 'TB MISS' MICRO TRAP IT WOULD SET BIT
            ;1857 ; 6 IN SCRATCH PAD R[0F]. WHEN THE TRAP OCCURRED, THE TRAP CATCHER
            ;1858 ; ROUTINE WOULD SENSE THAT THE TRAP WAS EXPECTED AND CLEAR BIT 6 IN
            ;1859 ; R[0F] AND DO A RETURN0.
            ;1860 ;
            ;1861 ; IF THE BIT FOR THE PARTICULAR TRAP IS NOT SET IN R[0F], THE TRAP ROUTINE
            ;1862 ; READS THE ERROR REGISTERS, SAVES THEM FOR TYPEOUT, AND MAKES AN ERROR CALL
            ;1863 ; TO THE CONSOLE.
            ;1864 ;
            ;1865 ; THE JUMP FIELDS OF ALL THE TRAP VECTORS EXCEPT THE CONTROL STORE PARITY
            ;1866 ; ERROR VECTOR, POINT TO A ROUTINE THAT EXECUTES A RETURN0 IF THE TRAP WAS
            ;1867 ; EXPECTED. THE CS PARITY ERROR VECTOR POINTS TO A ROUTINE THAT EXECUTES A
            ;1868 ; RETURN1 IF THE TRAP WAS EXPECTED SINCE THE ADDRESS THAT WAS PUSHED ON THE
            ;1869 ; STACK IS THE ADDRESS OF THE MICRO WORD WITH BAD PARITY.
            ;1870 ;-

            ;2573  .TOC "   Find MS780-E Memory"
            ;2574 ;++
            ;2575 ; FUNCTIONAL DESCRIPTION:
            ;2576 ;
            ;2577 ;          The diagnostic is designed to handle up to 4 (four)
            ;2578 ;     MS780-E/H's on the 780 SBI. This routine looks at all TR levels
            ;2579 ;     for a MS780-E memory unit.  Upon return, ID registers 3A through
            ;2580 ;     3D will hold the I/O base address of the MS780-E subsystems found
            ;2581 ;     on the SBI, and ID Register 3E will hold the Total number of
            ;2582 ;     MS780-E/H's found minus one.  Also, it is to be noted that the
            ;2583 ;     first MS780-E found will have its starting address set to 0
            ;2584 ;     (zero).
            ;2585 ;     All the other MS780-E/H's found will have their starting address
            ;2586 ;     set to all ones.  Subroutine ENABLE.NEXT.MS780E will look at ID
            ;2587 ;     Reg 3E to decide if there are any more MS780-E and will take
            ;2588 ;     apropriate action.  Register RC[0E] is used as a pointer to the
            ;2589 ;     current MS780-E unit under test.
            ;2590 ;     If any of: MS780-A, MS780-C or MA780 is found, its address is
            ;2591 ;     set to maximum.
            ;2592 ;

```
            ;2778  .PAGE
            ;2779  .TOC     ENABLE NEXT MS780-E
            ;2780 ;++
            ;2781 ; FUNCTIONAL DESCRIPTION:
            ;2782 ;
            ;2783 ;          This diagnostic will  be able to handle up  to  four  MS780-E units.
            ;2784 ;    They will be tested  separately, according to the TR level at which
            ;2785 ;    they are located,  starting with the one  at the lowest level first.
            ;2786 ;          When  a test has finished  with the first unit, it will have to call
            ;2787 ;    this specific  routine  to see  if any other MS780-E unit is present
            ;2788 ;    on the SBI. If more units are  present, the first one  will be  dis-
            ;2789 ;    abled  by  setting  its  starting  address to maximum, the next unit
            ;2790 ;    will be  enabled  by  setting its starting address to 0 and the test
            ;2791 ;    will be restarted. Subroutine  FIND.MS780E  will  look  on  the  SBI
            ;2792 ;    for  MS780-E/H  subsystems, and will leave their I/O base address in
            ;2793 ;    ID registers 3A through 3D and  a count of the Total number of units
            ;2794 ;    found - 1 in register 3E. In this subroutine the SC register is used
            ;2795 ;    as  a  pointer  to  ID  registers 3A through 3D.

;3250 ;
;3251 ; TEST DISCRIPTION
;3252 ;
;3253 ; THIS TEST TESTS THE CRD/RDS FAULT DETECTION LOGIC IN SBI NEXUS
;3254 ; EXCEPT THE CPU.
;3255 ;
;3256 ; THIS IS DONE BY PROGRAMMING THE NEXUS TO PERFORM A READ FROM MEMORY
;3257 ; WHILE THE MEMORY IS SETUP TO FORCE THE ERROR CONDITION.
;3258 ; THE NEXUS IS THEN CHECKED FOR THE CORRECT RESPONSE.
;3259 ;
;3260 ; ERROR LOGOUT

;1809 ;
;1810 ;
;1811 ; MODULE NAME: ESKAR58
;1812 ;
;1813 ; CREATION DATE:  SEPTEMBER 1982
;1814 ; AUTHOR:  DAN GRIGORE
;1815 ;
;1816 ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1817 ;
;1818 ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1819 ;
;1820 ; -  WHAT CHANGE WAS MADE
;1821 ;
;1822 ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1823 ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1824 ;
;1825 ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1826 ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1827 ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1828 ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1829 ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1830 ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1831 ;    ESKAR3C.
;1832 ;
;1833 ; START OF REVISION HISTORY:
;1834 ;
;1835 ;
;1836 ;
;1837 ;
;1838 ;
;1839 ;*****************************************************************************
;1840
```

```
            ;1841   .PAGE
            ;1842
            ;1843 ;*
            ;1844 ; FOLLOWING ARE THE MICRO TRAP VECTOR ASSIGNMENTS. EACH VECTOR LOADS THE SC
            ;1845 ; WITH A NUMBER, AND LOADS THE Q REGISTER WITH THE CONTENTS OF R[0F].
            ;1846 ; R[0F] IS SETUP BY THE PROGRAM TO INDICATE WHETHER A MICRO TRAP IS EXPECTED
            ;1847 ; THIS IS DONE BY SETTING THE BIT IN R[0F] THAT CORRESPONDS TO THE NUMBER
            ;1848 ; THAT IS LOADED INTO THE SC BY THAT PARTICULAR MICRO TRAP.
            ;1849 ;
            ;1850 ; FOR EXAMPLE: IF A TEST EXPECTED A 'TB MISS' MICRO TRAP IT WOULD SET BIT
            ;1851 ; 6 IN SCRATCH PAD R[0F]. WHEN THE TRAP OCCURRED, THE TRAP CATCHER
            ;1852 ; ROUTINE WOULD SENSE THAT THE TRAP WAS EXPECTED AND CLEAR BIT 6 IN
            ;1853 ; R[0F] AND DO A RETURN0.
            ;1854 ;
            ;1855 ; IF THE BIT FOR THE PARTICULAR TRAP IS NOT SET IN R[0F], THE TRAP ROUTINE
            ;1856 ; READS THE ERROR REGISTERS, SAVES THEM FOR TYPEOUT, AND MAKES AN ERROR CALL
            ;1857 ; TO THE CONSOLE.
            ;1858 ;
            ;1859 ; THE JUMP FIELDS OF ALL THE TRAP VECTORS EXCEPT THE CONTROL STORE PARITY
            ;1860 ; ERROR VECTOR, POINT TO A ROUTINE THAT EXECUTES A RETURN0 IF THE TRAP WAS
            ;1861 ; EXPECTED. THE CS PARITY ERROR VECTOR POINTS TO A ROUTINE THAT EXECUTES A
            ;1862 ; RETURN1 IF THE TRAP WAS EXPECTED SINCE THE ADDRESS THAT WAS PUSHED ON THE
            ;1863 ; STACK IS THE ADDRESS OF THE MICRO WORD WITH BAD PARITY.

            ;1935 ;++
            ;1936 ; FUNCTIONAL DESCRIPTION:
            ;1937 ;
            ;1938 ; This routine Initializes the following registers:
            ;1939 ;  PSL    to 1F
            ;1940 ;  CES    to 0
            ;1941 ;  ACC.CS   to disable accellerator
            ;1942 ;  SIR    to 0
            ;1943 ;  CLK.CS   to stop interval timer
            ;1944 ;  TBER0   to disable the TB
            ;1945 ;  SBI.MAINT to    0
            ;1946 ;  SBI.ERR   to 0
            ;1947 ;  FAULT    to 0
            ;1948 ;  COMP    to 0
            ;1949 ;  RC[0E]    to  0
            ;1950 ;  R[0F]    to 0
            ;1951 ; It also performs an SBI UNJAM and disables the CACHE.
            ;1952 ; A SCOPE call is then made to the Monitor.
            ;1953 ;
            ;1954 ; CALLING CONSTRAINT:
            ;1955 ;
            ;1956 ; =0
            ;1957 ;
            ;1958 ; SIDE EFFECTS:
            ;1959 ;
            ;1960 ; D Reg is destroyed
            ;1961 ; SC is destroyed
            ;1962 ;--
